Comparison between the effects of propofol-remifentanil and ketofol on seizure duration in electroconvulsive therapy

Protocol summary

Study aim

Comparison between the effects of propofol-remifentanil and ketofol on seizure duration in electroconvulsive therapy

Design

This study was conducted in parallel, double-blind, randomized, 40 people who were in the Phase 3 trial were designed

Settings and conduct

Patients are referred to pediatric psychology ward of al-Zahra hospital. The patients are randomly divided into two groups including group A who receives propofol+ketamine and group B who receives propofol+remifentanil. and the duration of seizure is detected in each patient. The Participants, Care provider, Outcome assessor, are not aware of the drug type and the investigator deciphers the codes after data analysis.

Participants/Inclusion and exclusion criteria

Inclusion criteria : patients candidates receiving electroconvulsive therapy seizures Subjects older than 6 years old and younger than 25 years old American Society of Anesthesiology physical status class 1,2 (ASA I, II) Exclusion criteria: subjects with severe cardiovascular disease, kidney disease, Liver disease, Chronic respiratory disease, drugs Allergy

Intervention groups

For all intervention groups, informed consent is obtained from the parents of patients. Then an appropriate peripheral vein is taken from the patients and the blood pressure and electrocardiography and pulse oximetry devices are connected to the patients, all patients receive 0.5 mg/kg succinylcholine. Intervention group A receives 1cc/20kg from a syringe filled with 2.5cc propofol+1cc ketamine + 1.5cc distilled water and intervention group B receives 1cc/20kg from a syringe filled with 2.5cc propofol+1cc remifentanil +1.5cc distilled water.

Main outcome variables

duration of seizure

Scientific title

Comparison between the effects of propofol-remifentanyl and ketofol on seizure duration in electroconvulsive therapy

Public title

The effect of the two drugs propofol-remifentanyl and ketofol in electroconvulsive therapy

Purpose

Treatment

Inclusion/Exclusion criteria

Inclusion criteria:

Patients candidates receiving electroconvulsive therapy seizures Patients older than 6 yeras old and younger than 25 years old Patients with American society of anesthesiology physical status class 1,2 (ASAI,II)

Exclusion criteria:

Severe cardiovascular disease Severe respiratory disease Severe kidney disease Severe Liver disease drugs Allergy

Age

From **6 years** old to **25 years** old

Gender

Both

Phase

3

Groups that have been masked

- Participant
- Care provider

Sample size

Target sample size: **40**

Randomization (investigator's opinion)

Randomized

Randomization description

Patients are randomly assigned to two groups A, B using the Random Allocation computer software.

Blinding (investigator's opinion)

Double blinded

Blinding description

All drugs are in one form and in the form of a volume in the syringe by the researcher, and the hemodynamic changes are monitored and recorded, so the attending and the clinical caregiver and the evaluator do not understand the type of medication.

Health conditions studied

1

Description of health condition studied

Seizure duration

ICD-10 code

ICD-10 code description

Primary outcomes

1

Description

Seizure duration

Timepoint

After intervention

Method of measurement

In seconds using a chornometer

2

Description

Heart rate changes

Timepoint

Before the intervention, 1 , 5, 10 minutes after intervention and After The discharge time of recovery

Method of measurement

Pulse oximetry device

3

Description

Mean arterial blood pressure

Timepoint

Before the intervention, 1 , 5, 10 minutes after intervention and After The discharge time of recovery

Method of measurement

Non invasive blood pressure

4

Description

Oxygen saturation

Timepoint

Before the intervention, 1 , 5, 10 minutes after intervention and After The discharge time of recovery

Method of measurement

Pulse oximetry device

5

Description

Recovery Duration

Timepoint

From the end of seizure to full consciousness

Method of measurement

Minute with using a chronometer

Secondary outcomes

1

Description

Nausea and Vomiting

Timepoint

After end of the seizure

Method of measurement

Questionnaire

2

Description

Laryngospasm

Timepoint

After end of the seizure

Method of measurement

Questionnaire

Intervention groups

1

Description

Intervention group A: Initially, personal consent is obtained from the patients. Then the patient is placed on the operating bed and standard monitoring devices including pulseoximetry, capnography, and electrocardiogram are attached. In this group 1cc/20kg from a syringe filled with 2.5cc propofol+1cc ketamine + 1.5cc distilled water is injected.
