

Clinical Trial Protocol

Iranian Registry of Clinical Trials

10 Jul 2026

Comparison of the effectiveness of adrenocorticotropin and aminophylline and caffeine; On the treatment of headache after tearing in patients with spinal anesthesia.

Protocol summary

Study aim

Evaluation the effectiveness of adrenocorticotropine and aminophylline in comparison with caffeine in treatment of headache after dural puncture .

Design

Clinical trials with control group, with parallel groups, randomized in 90 patients.

Settings and conduct

Clinical trial, Ayatollah Mousavi Hospital, Zanjan, Iran

Participants/Inclusion and exclusion criteria

Participants aged 18 to 45 years with a headache that improves with sleep, no contraindication of steroid therapy and absence of migraine headache, have the entry requirements for the study. Participants are excluded from the study with dissatisfaction, history of cardiac arrhythmias and drugs allergy.

Intervention groups

Female patients aged 18-45 years who have a headache after spinal anesthesia for cesarean section and have criteria for entering the study, will be divided into three groups using randomized blocked random sampling. The first group of caffeine tablets 300 mg twice a day, the second group of muscle ACTH injections, and the third group of aminophylline ampoules 250 mg per 100 ml of normal saline will be given in half an hour. The patient's VAS will be measured before intervention, as well as at hours 1, 6, 12, 24, and 48 after intervention. Within 48 hours after the intervention, if the patient complains of headache failure and their VAS is greater than or equal to 4, additional accommodation will be prescribed. Satisfaction will also be measured. The need for admission and epidural epidural blood patch is recorded and compared among all three groups

Main outcome variables

Headache severity, satisfaction of patients, need for additional analgesic up to 48 hours after treatment

Scientific title

Comparison of the effectiveness of adrenocorticotropin and aminophylline and caffeine; On the treatment of headache after tearing in patients with spinal anesthesia.

Public title

"Effect of caffeine, aminophylline and adrenocorticotropin on headache after spinal anesthesia"

Purpose

Treatment

Inclusion/Exclusion criteria

Inclusion criteria:

positional Headache that is aggravated by lying down and exacerbate by sitting and standing lack of steroid contraindication including: hypertension, diabetes No drug or any other palliative during surgery No history of migraine or psychotic and neurological disease No history of caffeine allergy

Exclusion criteria:

Patient dissatisfaction Heart arrhythmias

Age

From **18 years** old to **45 years** old

Gender

Female

Phase

3

Groups that have been masked

Health conditions studied

1

Description of health condition studied

postdural puncture headache post cesarean section

ICD-10 code

O89.4

ICD-10 code description

Spinal and epidural anaesthesia-induced headache during the puerperium

Primary outcomes

1

Description

Headache severity scale in VAS

Timepoint

At 0,1,6,12,24,48 hours intervals

Method of measurement

Visual Analog Scale questionnaire

Secondary outcomes

empty

Intervention groups

1

Description

Control group: Caffeine tablets 300 mg twice a day

Category

Treatment - Drugs

2

Description

Intervention group: 1 mg ACTH (synacthen, Iran hormones) intramuscular injection

Category

Treatment - Drugs

3

Description

Intervention group: Aminophylline Ampoules 250 mg (Sina Daru) Inside 100 ml normal

Category

Treatment - Drugs
