Evaluation of Interleukin 18 levels in saliva of patients with generalized Chronic periodontitis before and after Scaling and root planing

Protocol summary

Summary

Periodontitis is an infectious disease that associated with cytokine imbalance . Interleukin 18 is a biomarker that has an antioxidant action. Non-surgical treatment is one periodontal treatment method that affects etiologic factors. The aim of this study is investigated salivary Interleukin 18 concentration and its changes following non-surgical treatment in periodontal disease. Inclusion criteria is patient with moderate to severe periodontitis, gingivitis and healthy subjects. Patients with systemic disease will be excluded. Study groups include 25 patients with periodontal disease and 25 healthy subjects selected as controls. Intervention include Scaling and root planing. Unstimulated saliva was collected before and after Scaling and root planing. Changes in the concentrations of this cytokines is expected.

Health conditions studied**1****Description of health condition studied**

Chronic periodontitis

ICD-10 code

K05.3

ICD-10 code description

Chronic periodontitis

Primary outcomes**1****Description**

Interleukin 18

Timepoint

At the time of sampling

Method of measurement

ELISA kit

Secondary outcomes**1****Description**

Interleukin 18

Timepoint

Six weeks after sampling

Method of measurement

ELISA kit

2**Description**

Bleeding on probing

Timepoint

At the time of sampling

Method of measurement

By periodontal probe

Intervention groups**1****Description**

The intervention group: Scaling and root planning

Category

Treatment - Other
