Comparison of the effects of midazolam and dexmedetomidine on sedation levels, hemodynamics and complications in patients under brain stereotaxic surgery

Protocol summary

Study aim

Comparison of the effects of midazolam and dexmedetomidine on sedation levels, hemodynamics and complications in patients under brain stereotaxic surgery

Design

This study is a clinical trial with a control group ,parallel group, double blind, randomized, and sample size of 64 patients.

Settings and conduct

This study was a double-blind clinical trial that was performed on 64 patients undergoing stereotaxic surgery that referred to university hospitals of Isfahan University of Medical Sciences (Al-Zahra and Kashani). Patients in this study were randomly divided into two groups of 32 patients, one of them was sedated with midazolam, and the other group was sedated with dexmedetomidine. The blindness of this study was that patients and anesthetic technicians did not know any type of drug that was injected. Patients in the first group received midazolam at a dose of 1 mg/kg, and the second group received intravenous dose of 1 mcg /kg/min of dexmedetomidine.

Participants/Inclusion and exclusion criteria

inclusion criteria: 1)patients candidates brain stereotaxic surgery 2)age between 18 and 60 3)No history of allergic reaction to both midazolam and dexmedetomidin
exclusion criteria: 1)any change in anesthesia or surgery plan due to any complication 2)patient expiration during surgery

Intervention groups

Patients in this study were randomly divided into two groups of 32 patients, one of them was sedated with midazolam, and the other group was sedated with dexmedetomidine.

Main outcome variables

Hemodynamic parameters including systolic and diastolic blood pressure, heart rate and respiratory rate at preoperative time, 1, 3, 5, 10 and 20 minutes during

surgery, degree of sedation, patient and surgeon satisfaction, recovery time and complications of surgery including bleeding, low blood oxygen saturation and respiratory apnea was measured.

Asphyxia and hypoxemia

Primary outcomes

1

Description

systolic and diastolic blood pressure

Timepoint

preoperative periods, 1, 3, 5, 10 and 20 minutes during surgery

Method of measurement

Non-invasive barometer

2

Description

heart rate

Timepoint

preoperative periods, 1, 3, 5, 10 and 20 minutes during surgery

Method of measurement

pulse oximetry device

3

Description

respiratory rate

Timepoint

preoperative periods, 1, 3, 5, 10 and 20 minutes during surgery

Method of measurement

Count in minute

4

Description

drug sedation level

Timepoint

after end of surgery

Method of measurement

Ramsay sedation scale

5

Description

patient satisfaction

Timepoint

after end of surgery

Method of measurement

Visual Analogue Scale

6

Description

surgeon satisfaction

Timepoint

after end of surgery

Method of measurement

Iowa Satisfaction with Anesthesia Scale

7

Description

recovery time

Timepoint

From the moment of finishing surgery to full recovery time

Method of measurement

In minute using a chronometer

8

Description

bleeding

Timepoint

after end of surgery

Method of measurement

Bleeding above 50 cc

9

Description

low blood oxygen saturation

Timepoint

during surgery

Method of measurement

The drop in oxygen saturation below 90% by pulse oximeter

10

Description

respiratory apnea

Timepoint

during surgery

Method of measurement

Respiratory arrest for more than 8 seconds measured by chronometer

Secondary outcomes

empty

Intervention groups

1

Description

Intervention group A: Initially, personal consent is obtained from the patients. Then the patient is placed on the operating bed and standard monitoring devices including pulse oximetry, capnography, and electrocardiogram are attached. Patients in this group received midazolam at a dose of 1 mg/kg IV bolus.

Category

Treatment - Drugs

2

Description

Intervention group B: Initially, personal consent is obtained from the patients. Then the patient is placed on the operating bed and standard monitoring devices including pulsoximetry, capnography, and electrocardiogram are attached. The second group received intravenous dose of 1 mcg/kg/min of dexmedetomidine.

Category

Treatment - Drugs
