The effect of religious interventions on life expectancy in cancer patients undergoing chemotherapy

Protocol summary

Study aim

Determining the Effect of Religious Interventions on Life expectancy in Cancer Patients Under Chemotherapy

Design

The clinical trial included a control group, three blinded and randomized with a random table method. Religious interventions also take place, but the control group receives no intervention except routine nursing care.

Settings and conduct

This is an international study that will be conducted at Shahid Rahimi Hospital in Khorramabad city. Subjects undergoing chemotherapy will be included in the study after completing the informed consent form. After selecting the sample size, the units will be divided into two intervention and control groups. And international religious intervention sessions will be held for the intervention group. The data collection tool is a demographic questionnaire and Miller's standard of life expectancy questionnaire. In this study, the researchers, the patients participating in the study and the individual analyst will be blind.

Participants/Inclusion and exclusion criteria

Inclusion criteria Being in one type of cancer, having complete satisfaction to participate in the study, having at least one chemotherapy session, having reading and writing skills, having no mental illness, blindness and deafness in Aden. exclusion criteria Having chronic physical illnesses other than the mentioned disease, history of taking psychiatric and sedative drugs, history of using any drugs

Intervention groups

Intervention group: Patients with cancer undergoing chemotherapy and attending religious intervention sessions. Control group: Patients with cancer undergoing chemotherapy and not attending religious intervention sessions.

Main outcome variables

The Life expectancy

Randomization (investigator's opinion)

Not randomized

Randomization description

Blinding (investigator's opinion)

Triple blinded

Blinding description

n the present study, the researchers, the patients participating in the study and analyzing the data, were kept blind. The research units will be informed that they have participated in the study, but they are not informed that in the intervention group Or control group. Also, a researcher and religious expert who hold religious intervention sessions are also not aware of the type of patient control or intervention group. Ultimately, the individual who analyzes the research data also comes from a group of patients participating in the study. In the study, the data were not coded as intervention and control group data Took.
