Determining the effect of counseling based on PLISSIT model on sexual quality of life of married women with multiple sclerosis

Protocol summary

Study aim
Determining the effect of counseling based on PLISSIT model on sexual quality of life of married women with multiple sclerosis referring to MS center in Isfahan in 2019

Design
A randomized controlled Clinical trial

Settings and conduct
The research environment in this study is Isfahan MS Research Center. The participants in the experimental group will enter the study after obtaining permission from the physician and participated in 4 face-to-face individual training and counseling sessions, which will last 45 to 75 minutes per session and one session per week . All the research subjects will complete the questionnaires after two weeks and two months after the intervention.

Participants/Inclusion and exclusion criteria
Inclusion criteria: Married women who were diagnosed with multiple sclerosis at least 6 months ago; having sex during the last 6 months; being married longer than one year; having at least one sex problem; not suffering from other acute or chronic illness other than multiple sclerosis; not dealing with severe crises such as the deaths of close relatives over the past six months; having secondary and higher education and being available within the next month. Exclusion criteria : Severe marital conflicts (self-reported), pregnancy

Intervention groups
Experimental group: based on the PLISSIT model, face to face counseling was conducted weekly in 4 sessions and each session lasted between 45-75 minutes. Control group: they received no intervention and only pre-test and post-test were taken from the participants in this group. In addition, all the research subjects were asked to perform the follow-up and complete the questionnaires after two weeks and two months after the intervention. In order to observe ethical issues, a control group was also provided with an educational guide on the sexual quality of life.

Main outcome variables
sexual quality of life

Sample size

Target sample size: **62**

Actual sample size reached: **62**

Randomization (investigator's opinion)

Randomized

Randomization description

Selected samples were randomly assigned into two groups of control and experimental using cellphone. Sample size was calculated based on the statistical formula of 28 individuals in each group. It should be noted that 10% increase in the sample size was considered due to the probability of sample loss; therefore, 31 individuals were considered in each group.

Blinding (investigator's opinion)

Not blinded

Title and more details about the data/document
Demographic variables with university permission may be shared after unidentifiable individuals.
When the data will become available and for how long
Data will be available 3 to 6 months after the results are published in journal.
To whom data/document is available
The target group is academic researchers who have access to the data that interests them.
Under which criteria data/document could be used
Analysis on demographic variables is permitted.
From where data/document is obtainable
Refer to the corresponding author's email. mousavi1315@gmail.com
What processes are involved for a request to access data/document
It will be available in the journal 3 to 6 months after publication.
Comments
It also seems that the implementation of this model does not require advanced educational technologies and if healthcare professionals attend PLISSIT workshops, they can use the first three levels of the model for their patients, as a result, sexual problems are diagnosed and treated in the early stages.
