The effects of warming intravenous fluids on post operative shivering during ENT surgery

Protocol summary

2016-10-30, 1395/08/09

Summary

Due to the effectiveness of warm intravenous fluids to prevent perioperative hypothermia and thus reduce the shivering caused by hypothermia and considering the importance of controlling postoperative shivering, we decided to study the effectiveness of intravenous warm fluids in the prevention of shivering after ENT surgery. In a double blind randomized controlled clinical trial, 70 patients undergoing ENT surgery will be divided into 2 groups including one receiving of heated fluids (37 ° C) and one receiving liquids at operation room temperature and the core tympanic membrane temperature and postoperative shivering while recovery will be recorded. Patients premedication in both 2 groups will be Similar and General anesthesia will be started with Propofol 2 mg / kg and Atracurium 0.6 mg / kg and for maintenance of anesthesia after intubation 50% of Nitros Oxaid and oxygen and Isoflurane 0.7-1 % and infusion 5-8 µg /kg of Remifentanil will be used. Nasopharyngeal temperature will be recorded using a probe that will be placed through nose after anesthesia induction and will be kept in place until extubation. Primary variable is shivering and secondary variable is O2 saturation. Patients will be monitored for one hour in recovery room and post operational shivering and O2 saturation will be recorded .
