The effect of Pentoxifylline administration on placenta circulation and pregnancy outcome in Fetal Growth Restriction

Protocol summary

Study aim

Our purpose is to evaluate the effect of pentoxifylline on placenta perfusion by evaluation of cytokine and inflammatory factors related to Fetal Growth Restriction

Design

clinical trial with control group; With Parallel groups; Double blinded; randomized; design of 80 patients

Settings and conduct

In patient with fetal growth restriction and abnormal uterine ; umbilical and middle cerebral artery Doppler index who are referred to hospitals affiliated Shiraz University of medical sciences , before and after study blood sampling was done and level of cytokine and inflammatory factors (TNF α , sflt-1 , IL 1) evaluate and compare in each group.

Participants/Inclusion and exclusion criteria

Inclusion criteria: Women with age under 45 Y/o, Gestational age between 26-34 weeks Women with fetal growth restriction and abnormal Doppler finding in uterine; umbilical and middle cerebral artery. Exclusion criteria: high risk pregnancy (Multi fetal pregnancy; premature rupture of membrane; overt diabetes mellitus; Renal failure); Bleeding disorders

Intervention groups

Intervention group: 40 patients will be treated by Pentoxifylline sustained release tablet 400 mg manufactured by Farabi Pharmaceutical Company twice daily from beginning of study up to delivery time. control group: will be received placebo manufactured by Shiraz pharmacy school with the same method.

Main outcome variables

Variation the level of cytokine and inflammatory factors TNF α , sflt-1 , IL 1 before and after intervention.

Scientific title

The effect of Pentoxifylline administration on placenta circulation and pregnancy outcome in Fetal Growth Restriction

Public title

Effect of Pentoxifyllin on Fetal Growth Restriction

Purpose

Treatment

Inclusion/Exclusion criteria**Inclusion criteria:**

Women with age under 45 Y/o Gestational age between 26-34 weeks Women with fetal growth restriction and abnormal finding in uterine or umbilical artery Doppler with stage 1, 2

Exclusion criteria:

High risk pregnancy (Multi fetal pregnancy; premature rupture of membrane; overt diabetes mellitus; Renal failure; preterm labor pain; rheumatoid disease eg:Lupus) Bleeding disorders

Age

From **18 years** old to **45 years** old

Gender

Female

Phase

3

Groups that have been masked

- Participant
- Care provider
- Investigator
- Outcome assessor
- Data analyser
- Data and Safety Monitoring Board

Sample size

Target sample size: **80**

Randomization (investigator's opinion)

Randomized

Randomization description

Randomization method: use block; Random unit: Individual; Randomization tool: Statistical software Minitab; Sequence Building: Using randomized 4 in 4 blocks; Hiding method: Use similar bottles

Blinding (investigator's opinion)

Double blinded

Blinding description

Pentoxifylline and placebo have been administered in the similar bottles, so patients and researchers were unable to detect which one was Pentoxifylline or placebo. Our nurse colleague in this study in Hafez hospital delivered formulations to the participants of the study according to the randomized block table. She was unaware of the content of the bottles. The researcher had no information about formulation used by each patient while visiting them. At the end of the study, the formulations were decoded and the patients assigned to each group were identified.
