Clinical trial of the effect of melatonin on children with refractory seizure

Protocol summary

Study aim

The aim of this study was to compare the frequency of seizures, duration of seizures, possible complications, improvement of behavioral disorder and sleep cycle disorder before and after treatment with melatonin and placebo in intervention and control groups

Design

The study design is clinical trial with a control group, with parallel groups, single blind and simple randomization and patients will be studied in two groups of 25 cases.

Settings and conduct

In this clinical trial, children referred to the pediatric neurology clinic of BouAli Hospital in Sari are examined. Patients are blind and will be evaluated by simple random sampling

Participants/Inclusion and exclusion criteria

Children from 1 to 21 years with seizures who have not been controlled with at least three different antiepileptics and who have had at least four or more seizures a month before the study are included. Exclusion criteria are unrepeatable seizures, history of cardiovascular and neurodegenerative syndromes, liver and kidney dysfunction, history of pseudo seizures, blindness, lack of compliance (irregular drug use, unreliable parenting, severe and persistent progressive seizures), and a history of vasculitis.

Intervention groups

The intervention group will be prescribed melatonin tablet at a dose of 10 mg/m² body surface area in the form of a 3 mg tablet manufactured by Razak Pharmaceuticals. In the control group, placebo with the combination of tricalcium phosphate, magnesium stearate and starch adhesive is also given with a similar shape, color and taste. Patients will take the pills daily and one hour before bedtime (along with their anticonvulsants) for 4 weeks.

Main outcome variables

The main outcomes of the study are treatment response rate including seizure frequency, duration of seizure, possible complications, improvement of behavioral

disorder and sleep cycle disorder before and after the treatment.

Scientific title

Clinical trial of the effect of melatonin on children with refractory seizure

Public title

Effect of melatonin on refractory seizure of children

Purpose

Treatment

Inclusion/Exclusion criteria

Inclusion criteria:

Age 1 to 21 years with a history of seizure Seizure is not controlled with at least 3 different anticonvulsants At least four or more seizure episodes in last month

Exclusion criteria:

Treatable seizure History of cardiovascular syndromes Neurodegenerative syndromes Hepatic and renal dysfunction History of pseudo seizure Blindness Irregular drug use Unreliable parents History of vasculitis Severe and persistent progressive seizure

Age

From **1 year** old to **21 years** old

Gender

Both

Phase

3

Groups that have been masked

Sample size

Target sample size: **50**

Actual sample size reached: **50**

Randomization (investigator's opinion)

Randomized

Randomization description

Participants will be randomly assigned to two groups of intervention and control using block randomization with block sizes of 4. Randomization will be done using the software randomization option in Excel. The randomization process is performed by the study methodology consultant and clinical researchers are not aware of the randomization process.

Blinding (investigator's opinion)

Single blinded

Blinding description

Since the placebo capsule has the same shape, color, and taste of the intervention drug, the patient is blind and unaware of the drug being used.
