Effect of Melatonin on Coronary perfusion after primary percutaneous coronary intervention

Protocol summary

Study aim

The effect of melatonin on coronary perfusion after PPCI in patients with myocardial infarction

Design

Double blinded, controlled randomized trial

Settings and conduct

Patients with STEMI PPCI candidate referred to Modarres Hospital are divided into two groups. Patients in the case group will receive 3 mg of melatonin before PPCI and control group will receive placebo before PPCI without melatonin. The patient is not aware of the type of drug received. Doctors who perform PPCI and those who complete patient information are not informed about the type of medication being taken.

Participants/Inclusion and exclusion criteria

Inclusion criteria: being at least 18 years old; PPCI for the first 6 hours; STEMI evidence in patient electrocardiogram; blockage of one of the major coronary arteries; verbal Desire and Written Patient Satisfaction. Exclusion criteria: ESRD; history of autoimmune diseases; patient with severe illness with short prognosis; atrial fibrillation before or after PPCI; pregnancy or breast feeding.

Intervention groups

Case group will receive 3 mg of melatonin before PPCI and the control group will receive PPCI without melatonin

Main outcome variables

Changes in coronary artery perfusion

Scientific title

Effect of Melatonin on Coronary perfusion after primary percutaneous coronary intervention

Public title

Effect of Melatonin on Coronary perfusion after primary percutaneous coronary intervention

Purpose

Treatment

Inclusion/Exclusion criteria

Inclusion criteria:

Acute Myocardial infarction Age older than 18 years old
PPCI for the first 6 hours STEMI evidence in patient
electrocardiogram Blockage of one of the major coronary
arteries Verbal desire and written patient satisfaction to
participate in the study

Exclusion criteria:

Chronic renal failure A history of autoimmune disease
Atrial fibrillation Pregnancy or breast feeding

Age

From **18 years** old

Gender

Both

Phase

2-3

Groups that have been masked

No information

Sample size

Target sample size: **64**

Randomization (investigator's opinion)

Randomized

Randomization description

Eligible patients randomly assigned in 1:1 ratio and the
computer is classified into two groups of case and control

Blinding (investigator's opinion)

Not blinded

Health conditions studied

1

Description of health condition studied

Myocardial infarction

ICD-10 code

I21.3

ICD-10 code description

ST elevation (STEMI) myocardial infarction of unspecified
site

Primary outcomes

1

Description

Changes in coronary artery perfusion

Timepoint

Determination of coronary perfusion before PPCI and
within 40 days after PPCI

Method of measurement

Angiography and echocardiography

Secondary outcomes

empty

Intervention groups

1

Description

Intervention group: 3 mg melatonin given to patients
with myocardial infarction before PPCI instead of
melatonin.

Category

Treatment - Drugs

2

Description

Control group: patients with myocardial infarction who
receive placebo

Category

Placebo
