The effects of Duloxetine adjuvantive treatment on Negative Symptoms of Schizophrenia

Protocol summary

Study aim

The effect of duloxetine on the negative symptoms of schizophrenia

Design

Two arm parallel group randomised trial with blinded postoperative care and outcome assessment

Settings and conduct

In this double-blind randomized clinical trial study, 44 patients with schizophrenia with negative symptoms were recruited based on a structured clinical interview and DSM-IV basis at the Qods Hospital in Sanandaj or in outpatient clinics or centers. Patients in the intervention group were given 30 mg duloxetine in the first week and 60 mg daily in the second week to 7 weeks in addition to standard treatment. The positive and negative syndrome scale (PANSS) scale was evaluated at the beginning of the study, at week 4 and at the end of week 8. The drug and placebo are not recognizable, so a double-blind study is performed

Participants/Inclusion and exclusion criteria

Patients with schizophrenia: Patients with prominent negative symptoms: No severe depression in patients

Intervention groups

Patients in the intervention group were given 30 mg duloxetine in the first week and 60 mg daily in the second week until the 7th week. In the control group, the same dose was given to the control group.

Main outcome variables

Negative symptoms, positive symptoms, severity of psychiatric disorder, depression

Scientific title

The effects of Duloxetine adjuvantive treatment on Negative Symptoms of Schizophrenia

Public title

The effect of Duloxetine on the negative symptoms of schizophrenia

Purpose

Treatment

Inclusion/Exclusion criteria

Inclusion criteria:

Patients with schizophrenia Patients with prominent negative symptoms

Exclusion criteria:
major depression

Age

From **18 years** old to **59 years** old

Gender

Both

Phase

N/A

Groups that have been masked

- Participant
- Investigator

Sample size

Target sample size: **44**

Randomization (investigator's opinion)

Randomized

Randomization description

The patients will be randomly assigned to the intervention and control groups using block randomization The patients will be randomly assigned to the intervention and control groups using block randomization Arrangement of the randomization process: 1) Determining the volume of each block (quadruple blocks) 2) Preparing the list of the blocks and assigning a number (between 1 and 6) to each of them 3)Choosing random numbers between 1 and 6 4) Defining the treatment assignment list

Blinding (investigator's opinion)

Double blinded

Blinding description

The physician who will examine the patients will not be aware of the intervention. Therefore, the trial will be run as double blind.

Health conditions studied

1

Description of health condition studied

Negative symptom

ICD-10 code

ICD-10 code description

Primary outcomes

1

Description

Comparison of the positive and negative symptoms of schizophrenia

Timepoint

At baseline, 2, 4 and 8 weeks later

Method of measurement

Questionnaire for comparing positive and negative symptoms

Secondary outcomes

empty

Intervention groups

1

Description

Intervention group: Deloxitin powder, manufactured by Dana Gostar Pharmaceuticals and weighed with 10 mg precision scales, is poured into the empty capsules. Patients receive 30 mg of deluxitine and antipsychotic capsules daily for one week, and from the second week, they are given two capsules of 60 mg daily, lasting for 7 weeks.

Category

Treatment - Drugs

2

Description

Control group: The control group received placebo, which is completely uniform, colorless and odorless with the drug. Patients were given placebo for one week and two capsules for the second week and continued for 7 weeks.
