

Clinical Trial Protocol

Iranian Registry of Clinical Trials

06 Jul 2026

Evaluation the use of collagen membranes on the osteotomy window in the open sinus lift approach.

Protocol summary

Study aim

Evaluating the effect of using collagen membrane over the osteotomy window on newly formed bone and connective tissue in comparison with not using collagen membrane in lateral sinus lift surgery.

Design

Clinical trial with control group, with parallel groups, double-blind, randomized.

Settings and conduct

30 patients who required maxillary lateral sinus lift and referred to Mashhad Dental School, were evaluated and they were selected for this study. The patients were randomly allocated to control group (membrane) or test group (no membrane). After 6 months, they underwent the second surgery for implant placement. During implant placement, a bone biopsy was removed from the area where the implant was to be inserted and they were sent to the histological laboratory for histological evaluation. After evaluating the quality of histologic slices, newly formed bone and the connective tissue was examined with Image J software, the study was a double-blind study with a blind pathologist analyzing and blind pathologist.

Participants/Inclusion and exclusion criteria

Inclusion criteria: residual bone height 3 to 5 mm, good oral hygiene. Non inclusion criteria: head and neck radiotherapy, uncontrolled diabetes, pregnancy, pathologic lesion or sinus disease, uncontrolled periodontal disease, chemotherapy in the last 12 months before surgery.

Intervention groups

In control group, the bone window was covered with collagen membrane. In intervention group, the bone window was not covered with collagen membrane.

Main outcome variables

Measured variables include the amount of newly formed bone and connective tissue.

Scientific title

Evaluation the use of collagen membranes on the osteotomy window in the open sinus lift approach.

Public title

Evaluation of the use of collagen membranes in comparison with non-use of membranes in sinus floor surgery.

Purpose

Treatment

Inclusion/Exclusion criteria

Inclusion criteria:

The remaining bone height is 3 to 5 mm. Good oral hygiene.

Exclusion criteria:

Radiotherapy in the head and neck area. Uncontrolled diabetes. Pregnancy. Pathological lesion or sinus disease. Uncontrolled periodontal disease. History of chemotherapy in the last 12 months before surgery.

Age

No age limit

Gender

Both

Phase

N/A

Groups that have been masked

Actual sample size reached: **30**

Randomization (investigator's opinion)

Randomized

Randomization description

In this study, randomization is based on random number table. Randomization type: Simple randomization. This method uses simple randomization models such as tap or line, use of random numbers table or computer randomization methods, and each client for example with throws coin, tap and line, put it in the intervention or control group or It is very simple to implement.

Blinding (investigator's opinion)

Double blinded

Blinding description

This is a double blind study. Statistical analyst and pathologist evaluator were blind.

Health conditions studied

1

Description of health condition studied

Study on Maxillary Sinus Lift Surgery.

ICD-10 code

XXI

ICD-10 code description

Factors influencing health status and contact with health services

Primary outcomes

1

Description

The amount of newly formed bone in patients undergoing sinus lift surgery.

Timepoint

Measurement of newly formed bone is performed 6 months after sinus lift surgery and at implant placement time.

Method of measurement

The amount of newly formed bone in each slide was calculated by the image j software. It gives a number that specifies the surface area of each slide. Finally, the number obtained for each patient that represents the amount of newly formed bone is entered into the Statistical Package for Social Sciences (spss) software.

2

Description

The amount of connective tissue in patients undergoing sinus lift surgery.

Timepoint

Measurement of connective tissue is performed 6 months after sinus lift surgery and at implant placement time.

Method of measurement

The amount of connective tissue in each slide was calculated by image j software. It gives us a number that specifies the surface area of each slide. Finally, the numbers obtained for each patient indicating the amount of connective tissue are entered into the Statistical Package for Social Sciences (spss) software.

Intervention groups

1

Description

"Intervention group:" No collagen membrane use over the bone window in open sinus lift surgery. at first the crestal incision was made in the maxillary posterior tooth and lateral sinus wall and two mesial and distal liberator incisions were made for better access, and then the mucopriosteal flap was raised as full-thickness for lateral sinus wall exposure from the bone. Then the bone window was created according to the dimensions of the area. After exposure of the Schneiderin membrane, using sinus membrane brushes, the sinus membrane was separated from the bone and the bone window was directed upward. Then, coarse-grained allografts of size 1000–2000.(Mineralized and Demineralized Blend) was Compressed in Place and Without covering the bone window by the membrane, the mucoperiosteal flap was placed over the area and finally sutured with a 3-0 suture.
