Comparison of Propofol alone and Propofol with Muscle relaxant on hemodynamic and LMA insertion condition during induction of anesthesia

Protocol summary

Study aim

Comparison of Propofol alone and Propofol with Muscle relaxant on hemodynamic and laryngeal mask airway insertion condition during induction of anesthesia.

Design

A double-blind clinical trial, with Parallel and randomized groups of 70 patients ranging in age from 18 to 65 years with ASA I and II who is candidates for elective surgery. Randomization will be done based on Block Randomization method using Allocation Random software.

Settings and conduct

This double blind clinical trial study will be conducted at Shahid Mohammadi hospital in Bandar Abbas. LMA with appropriate size will be improvised in sniffing position and the data will be recorded by an anesthesiologist who is not aware of the study

Participants/Inclusion and exclusion criteria

Inclusion criteria: patients between 18-65 years of age, physical condition (ASA I and II), are candidates for elective surgery. Non-inclusion criteria: drug allergy, emergency patients, patients with full stomach, patients with a history of upper respiratory tract infection, high intra cranial pressure (ICP), asthma, COPD, obesity (BMI<40)

Intervention groups

Intervention group 1: Intravenous injection of 2.5 mg/kg propofol with saline (Dose equal to cisatracurium).
Intervention group 2: Intravenous injection of 2.5 mg/kg propofol with 0.2 mg/kg cisatracurium.

Main outcome variables

Patient hemodynamic situation; laryngeal mask airway insertion (LMA)

Scientific title

Comparison of Propofol alone and Propofol with Muscle relaxant on hemodynamic and LMA insertion condition during induction of anesthesia

Public title

Use of muscle relaxants in laryngeal mask airway insertion

Purpose
Treatment

Inclusion/Exclusion criteria
Inclusion criteria:
 Patient age between 18-65 years Physical Condition (ASA I and II) Candidate for elective surgery
Exclusion criteria:
 Drug sensitivity Emergency patients Patients with full stomach Patients with a history of upper respiratory tract infection Asthma COPD Obesity BMI <40 High ICP

Age
From **18 years** old to **65 years** old

Gender
Both

Phase
2

Groups that have been masked

- Participant
- Care provider

Sample size
Target sample size: **70**

Randomization (investigator's opinion)
Randomized

Randomization description
Random allocation was done using block randomization method and Random Allocation software and 70 patients were divided into two groups of 35 patients.

Blinding (investigator's opinion)
Double blinded

Blinding description
Patients are unaware of being in which group. LMA insertion and data recording was done by an experienced anesthesiologist who was not aware of the study process.

Placebo
Used

Assignment
Parallel

Health conditions studied

1

Description of health condition studied
Finding an easy and safe way to operate LMA with minimal complications

ICD-10 code

ICD-10 code description

Primary outcomes

1

Description
Hemodynamic changes after injection

Timepoint
Before induction of anesthesia, before, during, and 1, 3 and 5 minutes after LMA insertion

Method of measurement
Hemodynamic changes registration form

2

Description
The laryngeal mask airway insertion status after injection

Timepoint
Evaluation of LMA insertion variable changes before, during, and 1, 3 and 5 minutes after LMA insertion.

Method of measurement
Ease of masking table, table parameters during insertion, removal of the LMA and duration of surgery.

Secondary outcomes

empty

Intervention groups

1

Description
Intervention group: Intravenous propofol 2.5 mg/kg(PROPOFOL1 mg/10 ml, B Braun Co, in Germany) and 0.2 mg/kg cisatracurium (muscle relaxant)(Cisatrecurium 10mg/5ml Rosamed-Iran) were injected. After 4 minutes of ventilation with pure oxygen, the LMA of appropriate size was standardized by an anesthesiologist who was unaware of the study and the information was recorded in a form.

Category
Treatment - Drugs

2

Description

Control group: 2.5 mg/kg propofol (PROPOFOL1 mg/10 ml, B Braun Co, in Germany) and normal saline were injected with equal volume of relaxant. After 4 minutes of ventilation with pure oxygen, the LMA of appropriate size was standardized by an anesthesiologist who was unaware of the study and the information was recorded in a form.
