

Clinical Trial Protocol

Iranian Registry of Clinical Trials

30 May 2026

Comparison of the effect of tranexamic acid and intravenous desmopressin on reducing bleeding during septorhinoplasty.

Protocol summary

Study aim

Comparison of the effect of tranexamic acid and intravenous desmopressin on reducing bleeding during septorhinoplasty.

Design

This study is a randomized, double-blind, phase 3 clinical trial with a sample size of 175 patients randomly assigned to three groups. The first group receives tranexamic acid. The second group received desmopressin. And the third group is given placebo

Settings and conduct

In this study, 177 patients undergoing septorhinoplasty will be divided into three groups including intravenous tranexamic acid, intravenous desmopressin and placebo. All patients will receive the same premedication and all patients will receive propofol during surgery. and remifentanyl is given during the operation depend on the blood pressure and heart rate and if the blood pressure is not controlled, propofol will increase and then Depending on the heart rate and blood pressure, TNG and labetalol will be used. The amount of bleeding is determined by the volume of the suction and the amount of blood in the gases. Surgeons' satisfaction from the operating field is measured by a questionnaire. The PT, PTT, INR and platelet counts were compared before and after the surgery. This study was performed at Rasool Akram Hospital in Tehran.

Participants/Inclusion and exclusion criteria

Perform Septorhinoplasty No coagulation disorders 18 Years until 50 Years ASA-1

Intervention groups

In the first intervention group, Tranexamic acid was injected half an hour before surgery at a dose of 5 mg / kg. And in the second intervention group Desmopressin injected at 4 µg / ml half an hour before surgery And in the control group the same amount of placebo is given with similar characteristics.

Main outcome variables

Age Gender Suction volume Number of gases PT PTT INR

Scientific title

Comparison of the effect of tranexamic acid and intravenous desmopressin on reducing bleeding during septorhinoplasty.

Public title

Comparison of the effect of tranexamic acid and intravenous desmopressin on reducing bleeding during septorhinoplasty.

Purpose

Treatment

Inclusion/Exclusion criteria

Inclusion criteria:

Perform septorhinoplasty No coagulation disorders 18 Years until 50 Years ASA-1

Exclusion criteria:

Contraindications for the administration of Tranexamic acid and Desmopressin Dissatisfaction with research Drug addiction Being a smoker

Age

From **18 years** old to **50 years** old

Gender

Both

Phase

3

Groups that have been masked

- Care provider
- Investigator

Sample size

Target sample size: **175**

Actual sample size reached: **175**

Randomization (investigator's opinion)

Randomized

Randomization description

This study was designed as a clinical trial in which the number of patients was determined according to the sample size formula and the patients were randomly selected using a simple randomization method that provided a data code to each patient using a random number table. By random selection of the code, patients were assigned to three treatment groups without observing the patients' codes.

Blinding (investigator's opinion)

Double blinded

Blinding description

The researcher is unaware of the process of prescribing medications and control groups, as well as those who provide care and treatment to the patients participating in the study.

Description of health condition studied

Septorhinoplasty

ICD-10 code

B46.1

ICD-10 code description

Rhinocerebral mucormycosis

Primary outcomes

1

Description

Bleeding

Timepoint

During surgery

Method of measurement

The amount of bleeding is determined by the volume of the suction and the number of blood gases.

Secondary outcomes

1

Description

Blood pressure

Timepoint

During surgery

Method of measurement

With barometer

2

Description

Heart rate

Timepoint

During surgery

Method of measurement

Pulse Oximeter

Intervention groups

1

Description

Intervention group: Intravenous tranexamic acid, produced by Caspian Drug Co., 500 mg / 5 ml, half an hour before surgery, 5 mg / kg, intravenously.

Category

Treatment - Drugs

2

Description

Intervention group: Desmopressin is an injection produced by the Razavi Pharmaceutical Services Institute, which is administered intravenously at a dose of 4 µg / ml once a half hour before surgery.

Category

Treatment - Drugs

3

Description

Control group: Placebo is similar to both transaminic acid and desmopressin from distilled water and used intravenously half an hour before surgery.

Category

Placebo
