

Clinical Trial Protocol

Iranian Registry of Clinical Trials

19 Sep 2026

The Efficacy assessment of high definition cathodal transcranial direct current stimulation in treatment of patients with drug-resistant epilepsy

Protocol summary

Study aim

Determining the efficacy of brain stimulation in improving patients with drug-resistant epilepsy

Design

Randomised, parallel group (two group) trial with blinded outcome assessment.

Settings and conduct

The present study conducted in the Dr. Bahonar hospital, Kerman and in each group 20 patients were assessed. patients, main investigator and data analyser did not know the patients allocations.

Participants/Inclusion and exclusion criteria

patients with drug resistant epilepsy over 18 years of age that were not good candidate for epilepsy surgery or waiting for this type of surgery

Intervention groups

Group one : Ten participants (experimental group) receive cathodic stimulation in a 2 mA current for 30 minutes for 10 consecutive days on the epiptogenic area, which is localized by long-term video-ECG monitoring. Group two : In ten patients for sham stimulation, the electrodes are placed in exactly the same position as the active stimulation on the scalp and the patient receives stimulation for only 60 seconds. However, the electrodes remain in place for 30 minutes. . The flow increases slowly in the first 15 seconds and decreases slowly in the last 15 seconds. Patients develop a sense of pruritus and murmur, but receive no flow for the remaining 29 minutes.

Main outcome variables

Reduction of epileptic seizures in patients with drug resistant epilepsy

Scientific title

The Efficacy assessment of high definition cathodal transcranial direct current stimulation in treatment of patients with drug-resistant epilepsy

Public title

The assessment efficacy of electrical brain stimulation

among patients with drug-resistant epilepsy

Purpose
Treatment

Inclusion/Exclusion criteria
Inclusion criteria:
age ≥ 18 y/o all of patients full filled ILAE criteria of drug-resistant epilepsy participants were not good candidate for epilepsy surgery and or they will not surgery or they waited for epilepsy surgery. obtaining signed consent
Exclusion criteria:
scalp diseases (such as eczema, skin lesions) previous intracranial surgery, intracranial metal (out of mouth) such as cracking, surgical clip implanted device such as cardiac pacemaker, VNS, Cochlear implantation recurrent or severe headaches previous head trauma and other related brain diseases pregnancy and lactation

Age
From **18 years** old

Gender
Both

Phase
N/A

Groups that have been masked

- Data analyser

Sample size
Target sample size: **22**

Randomization (investigator's opinion)
Randomized

Randomization description
In this study, patients randomly divided in two groups (20 patients in each group) using random allocation sequence with SAS statistical software. according to this method a simple randomization list product and patients' involvement in each group determine base on order entry. we used sequentially numbered, sealed opaque envelopes for allocation concealment. patients (individuals) were the randomization units.

Blinding (investigator's opinion)
Triple blinded

Blinding description
Patients, main investigator and data analyser were masked of patients allocation. patients did not know the name of group and treatments. we used Sham for patients in control group. all questionnaire completed in different periods without name and only the related nurse know the patients allocations

Health conditions studied

1

Description of health condition studied

drug resistant epilepsy

ICD-10 code

G40.21

ICD-10 code description

Localization-related (focal) (partial) symptomatic epilepsy and epileptic syndromes with complex partial seizures, intractable

Primary outcomes

1

Description

Investigating changes in the frequency of epileptic seizures

Timepoint

before intervention and monthly for 3 months

Method of measurement

seizure diary

2

Description

Investigating the frequency changes of interictal epileptiform discharges

Timepoint

immediately before and after intervention and then monthly for 3 months

Method of measurement

30 minutes standard EEG

3

Description

side effects

Timepoint

immediately after stimulation

Method of measurement

specialist visit

4**Description**

quality of life

Timepoint

before intervention and after 3 months

Method of measurement

full filling of the QoL in Epilepsy Inventory-89

Secondary outcomes

empty

Intervention groups**1****Description**

Intervention group: Patients with drug-resistant epilepsy who are not good candidates for epilepsy surgery or who do not want surgery or are waiting for surgery. In all patients, the epileptogenic zone is localized during prolonged EEG video-EEG monitoring, and epileptogenic lesions are diagnosed by brain epilepsy with epilepsy protocol. Their antiepileptic drugs did not change during the study period. Participants are randomly assigned to an experimental or sham group. Ten participants (experimental group) received HD c-tDCS intervention in a 2 mA current for 30 minutes for 10 consecutive days over the epileptogenic zone. The standard 30-min brain tape will be administered in two groups immediately before and after the first and monthly stimulation for three months. Patients will also be tracked by the cigarette calendar. The frequencies of the intraeclal epiglottis signals and waves before and after HD C-TDCS will be compared statistically. Quality of life (QoL) of patients will be assessed by QoL-Epilepsy Questionnaire -89 before the intervention and after three months. After each session of stimulation, side effects will be questioned and recorded.
