

Clinical Trial Protocol

Iranian Registry of Clinical Trials

07 Jun 2026

Comparison of the efficacy of intravenous propofol infusion with conservative treatment in outcome of patients with severe intracerebral hemorrhage hospital based

Protocol summary

Study aim

Comparison of the efficacy of 24-hour intravenous propofol infusion with conservative treatment in outcome of patients with severe intracerebral hemorrhage

Design

After selecting the patients and explaining the study and the purposes of the study for their legal status, written consent was obtained and patients randomly assigned to the study will be divided into two groups receiving propofol infusion and control group patients.

Settings and conduct

After obtaining permission from the Ethics Committee of Qom University of Medical Sciences, the present study will be conducted in a clinical trial in patients with intracerebral hemorrhage who are not candidates for craniotomy. The implementation of this research project will be undertaken with the informed consent of the study and the medicines and their effects on all patients or their relatives, and it will be possible to withdraw from the study at any time without difficulty. The study site of the teaching hospitals in Qom city.

Participants/Inclusion and exclusion criteria

Inclusion criteria: • Patients with acute ICH aged 15 years or older • Having a NIHSS score above 15 • No surgical indication by the neurosurgical team
Exclusion criteria: • A history of allergy to the drugs used in the study • Pregnancy and lactation • Chronic renal failure, liver or any concomitant chronic illness • Concomitant malignancy

Intervention groups

The present study will be a clinical trial on patients with severe intracerebral hemorrhage (NIHSS > 15) who are not candidates for craniotomy. The experimental group will receive propofol intravenous infusion at a dose of 75-75 µg / kg / min for the first 24 hours in addition to the usual care and treatment used in the control group.

Main outcome variables

Mean mRS; NIHSS; mortality rate; length of hospitalization; intubation time; extent of bleeding; rate of edema and bleeding complications

Scientific title
Comparison of the efficacy of intravenous propofol infusion with conservative treatment in outcome of patients with severe intracerebral hemorrhage hospital based

Public title
"Effect of propofol in severe intracerebral hemorrhage "

Purpose
Treatment

Inclusion/Exclusion criteria

Inclusion criteria:

Acute ICH over 15 years of ages No surgery indication by the neurosurgery team NIHSS above 15

Exclusion criteria:

Pregnancy &lactation Concurrent Malignancy CKD or chronic hepatic failure or another chronic sickness
History of drug sensitivity used in the study

Age
From **15 years** old

Gender
Both

Phase
3

Groups that have been masked

- Investigator

Sample size
Target sample size: **112**

Randomization (investigator's opinion)
Not randomized

Randomization description

Blinding (investigator's opinion)
Single blinded

Blinding description

At all stages of the study, the researchers responsible for evaluating the outcome of the patients would be blind to the grouping performed.

Placebo
Not used

Intervention groups

1

Description

In addition to routine treatment and care, a 25-75 µg / kg / min intravenous infusion will be used within the first 24 hours. NIHSS, GCS and bleeding volume will be recorded on arrival and daily for up to 7 days. Also, mortality rate, duration of hospitalization, extent of hemorrhage and mRS, NIHSS, GCS in the group receiving propofol will be compared using appropriate statistical tests. Cardiac wall, measurement of oxygen saturation of peripheral blood by pulse oxy meters, standard neurological treatments and standard rehabilitation measures will be performed.

Category

Treatment - Drugs

2

Description

Control group: In patients of the intervention group routine supportive measures in patients with intracerebral hemorrhage hospitalized in the intensive

care unit such as blood pressure measurement, ECG monitoring, measurement of peripheral blood oxygen saturation by pulse oximeter, standard neurological treatments and Standard rehabilitation procedures will be performed. All demographic and clinical information of patients will be recorded in questionnaires designed by researchers and the amount of mRS, NIHSS, GCS and bleeding volume will be recorded at the beginning of the day and up to 7 days. Also, mortality rate, duration of hospitalization, extent of hemorrhage expansion and rate of mRS, NIHSS, GCS in the control group will be compared using appropriate statistical tests. Standard neurological treatments and standard rehabilitation measures will be performed.
