

Clinical Trial Protocol

Iranian Registry of Clinical Trials

16 Sep 2026

Developing of Acceptance and Commitment Therapy (ACT) protocol based on psychological problems in people with prostate cancer and its effectiveness on health-related quality of life and psychological distress of them.

Protocol summary

Study aim

If the research hypotheses are proven, Acceptance and Commitment therapy (ACT) can be used in treatment centers to help treat patients with prostate cancer and have a significant role in improving the quality of life associated with the health and psychological distress of these patients.

Design

Controlled clinical trial, not blind, randomized design

Settings and conduct

At the Labafi Nejad Hospital, patients' files are reviewed and interviewed in the presence of the Dr. Mofid. If satisfied, patients complete the questionnaires in the pre-test and post-test stages. The treatment protocol is performed in 8 sessions on the intervention group at the Dr. Clinic.

Participants/Inclusion and exclusion criteria

Inclusion criteria: Age between 50 and 75 years; Diagnosed prostate cancer in patients who completed standard therapies; Exclusion criteria: Mental disorders and other cancers.

Intervention groups

The ACT Therapy protocol will be administered to the experimental group to improve health-related quality of life and reduce psychological distress in patients with prostate cancer, and the control group will continue their treatment.

Main outcome variables

The main implications of this study are: psychological problems as measured by the DASS-21 scale; Quality of life is dependent on health as measured by the questionnaire (SF 36). The main consequences are pre-test and post-test.

Phase N/A	Primary outcomes
Groups that have been masked <i>No information</i>	1 Description Psychological Problem Score on the Short Form of Depression, Anxiety and Stress Scale (DASS 21); Physical and Mental Health Score in Health Related Quality of Life Questionnaire (SF 36) Timepoint At the beginning of the study (before the intervention) and after 8 sessions of acceptance and commitment group therapy Method of measurement The Short Form of Depression, Anxiety and Stress Scale (DASS 21); Health Related Quality of Life Questionnaire (SF 36)
Sample size Target sample size: 40	Secondary outcomes
Randomization (investigator's opinion) Randomized	
Randomization description Based on the inclusion criteria and a pre-test session, 40 men who scored lower than average after completing the Depression, Anxiety and Stress Questionnaire (DASS 21) had health-related quality of life (SF 36). Since the study groups have equal sample size, we use simple random allocation law which is one of the limited randomization methods and we divide people into two groups of intervention and control. Keep notes of patients on 40 separate sheets and place the sheets inside the draw container and then we randomly record the 20 sheets out of the container into the intervention group and place the remaining 20 sheets in the control group. If there is a loss in treatment sessions, the sample size will be randomly eliminated in order to equalize the sample size and eventually the number of subjects in both groups should be the same. The experimental group (n=20) will have 8 sessions of 120-minute Acceptance and Commitment therapy and the control group will receive no intervention.

1

Description

Health-related quality of life score and psychological problems score

Timepoint

Health-related Quality of Life Questionnaires (SF 36) and Depression, Anxiety and Stress Short Form (DASS 21) at baseline (before intervention) and after treatment protocol

Method of measurement

The Depression, Anxiety and Stress Questionnaire (DASS 21) Health-related quality of life (SF 36)

Intervention groups

1

Description

Acceptance and Commitment Therapy (ACT) has six central processes that lead to psychological flexibility. These six processes are: "Acceptance, Faulting, self as context, present-day communication, recognizing values and committed action Intervention group". In fact the purpose of Acceptance and Commitment therapy, is not to make a direct change in the client. Rather, its purpose is to help clientele communicate their experiences in different ways and be able to engage completely with meaningful, value-based life. The proposed protocol is based on the Acceptance and Commitment Book by Hayes, Strausell and Wilson. In the intervention group: Twenty patients have prostate cancer before the protocol is implemented In the pre-test, they completed the Short Form of Depression, Anxiety and Stress Questionnaire (DASS-21) and Health-Related Quality of Life (SF-36) with full specifications. In the intervention group, the Acceptance and Commitment Therapy protocol (ACT) will be conducted in eight consecutive 90-minute sessions in 4 consecutive weeks.
