

# Clinical Trial Protocol

## Iranian Registry of Clinical Trials

25 Jul 2026

### Investigation the effect of verbal communication on the level of consciousness, pain and agitation in patients admitted to Intensive Care Unit

#### Protocol summary

##### Study aim

Determining the effect of verbal communication on the level of consciousness, pain and agitation in patients admitted to Intensive Care Unit in Ali-Ebne Abitaleb Hospital in Rafsanjan City in 2019

##### Design

Two arm parallel-group randomized trial with blinded intensive care and outcome assessment. Patients' level of consciousness, pain, and restlessness will be measured in 35 patients in the intervention group and 35 patients in the control group.

##### Settings and conduct

This study is a randomized, double blind clinical trial performed on patients admitted to intensive care units of Ali-Ebne Abitaleb Hospital in Rafsanjan. Patients in the intervention group will receive verbal communication twice a day for 14 days. The control group will under routine care. In the intervention group, the patient's level of consciousness is measured by Glasgow Coma Scale (GCS) for level of consciousness, Behavioral Scale for Pain (BPS criteria) and restlessness with the Rass criterion before and 15 minutes after verbal communication by someone other than the researcher. In this study, patients beacuse of low conscious and evaluator did not know about control group or intervention group

##### Participants/Inclusion and exclusion criteria

Age 15-75 years  $GCS \leq 8$  Traumatic and non-traumatic patients No previous history of brain injury No history of hearing impairment, or hearing loss stabilizing vital signs in patient in the intensive care unit

##### Intervention groups

Intervention group: Patients in the intervention group receive verbal communication twice a day for one week.  
Control group: receive routine care.

##### Main outcome variables

level of consciousness, pain and restlessness
