Effect of prophylactic oral administration of acetaminophen on patent ductus arteriosus(PDA) closure in preterm neonate admitted in NICU section of Ali ibn Abitaleb Hospital in Zahedan in 2019-2020

Protocol summary

Study aim

Evaluation prophylactic oral acetaminophen administration on patent ductus arteriosus closure in preterm neonates based on gestational age and arterial diameter

Design

All preterm neonates with gestational age less than 32 weeks and weight less than 1500 g born in the NICU ward of Ali Ibn Abi Talib Hospital in Zahedan were randomly divided into the intervention group and received acetaminophen 15 mg / day in the intervention group. Each kilogram of body weight is given then on the fifth day of echocardiography will be performed.

Settings and conduct

The study will be carried out at Ali Ibn Abi Talib Hospital in Zahedan and the pediatric cardiologist who performs echocardiography is not aware of the neonatal segmentation.

Participants/Inclusion and exclusion criteria

Inclusion criteria: all preterm infants less than 32 weeks gestation and weight less than 1500 gr. Exclusion criteria: congenital heart disease; congenital major anomalies; non-steroidal anti-inflammatory drug use during pregnancy; persistent pulmonary hypertension; Apgar score less than 5; vomiting and hematemesis; G6PD deficiency; sepsis; intraventricular hemorrhage; urine output less than 1cc/kg/hr; creatinine greater than 1/8 mg/dl; platelet less than 50,000; necrotizing enterocolitis.

Intervention groups

The infants in the intervention group will be given an oral acetaminophen dose of 15 mg / kg from the first day of birth, then echocardiography will be performed on the fifth day of birth. In control group no intervention is performed.

Main outcome variables

Patent ductus arteriosus closure in preterm infants
