The Comparison of Mobile Learning via Short Message Service with a Paper Based Method in learning rates of Medical Residents

Protocol summary

Summary

The aim of this study is to compare the rate of learning via the short message service and a paper-based method in residents of gynecology and obstetrics. This is a clinical trial -single blind study. Inclusion criteria included resident of gynecology and obstetrics. If they do not participate in all tests, they are excluded from this study. The study population is a group of 25 residents of Gynecology and Obstetrics in different years of study in Arash Women's Hospital and the disputed subject is breast cancer. A questionnaire including 20 multiple choice questions about breast cancer is designed as pre-test and post-test. All the residents take the pre-test at the same time. Ten days later, the first set of subjects (epidemiology, screening, manifestations, diagnosis and staging) is handled in 54 messages and is sent via cell phone to the residents during 16 days. Two or 3 SMS are sent daily at approximately exact times. The same residents also receive a 7-pages booklet handling the second set of subjects 9 days after the pre-test and are asked to study it in the same 16-day period. In the next step, 5 days after the last message, the post-test exam is undertaken. The test results are scored according to the number of correct answers and the results is compared in order to evaluate the learning rates.
