Comparison of the immediate effect of passive static stretching and post isometric relaxation techniques on the pain and upper trapezius muscle stiffness in people with chronic nonspecific neck pain using sonoelastography

Protocol summary

Study aim

Comparison of the immediate effect of passive static stretching and post isometric relaxation techniques on pain and upper trapezius muscle stiffness in people with chronic nonspecific neck pain using sonoelastography

Design

Double blind and block randomised trial with two parallel groups. The first group is the control group which is a static passive stretch for upper trapezius muscle, second group is the intervention group, which is a post isometric relaxation technique.

Settings and conduct

In initiation, the end of treatment, outcomes are evaluated by sono-elastography, Visual analog scale (VAS) & questionnaire. According to the subject's group, static passive stretch/ post isometric relaxation technique for upper trapezius muscle is performed at the sonography ward of Golestan educational hospital, Ahvaz for 1 session. Participants and outcomes assessor will be blind to intervention type and grouping.

Participants/Inclusion and exclusion criteria

Inclusion: 1. 18-50 years, 2. Discomfort sense in the upper trapezius muscle, 3. Neck pain for the three months ago, 4. Neck disability questionnaire score more than 5.

Intervention groups

Control group: upper trapezius muscle static passive stretch, Intervention group: upper trapezius muscle Post isometric relaxation technique.

Main outcome variables

Upper trapezius muscle stiffness

Scientific title

Comparison of the immediate effect of passive static stretching and post isometric relaxation techniques on

the pain and upper trapezius muscle stiffness in people with chronic nonspecific neck pain using sonoelastography

Public title

Upper trapezius muscle elastography in neck pain

Purpose

Treatment

Inclusion/Exclusion criteria

Inclusion criteria:

Discomfort sense in upper trapezius muscle Neck pain for the three months ago Neck disability questionnaire score more than five

Exclusion criteria:

Neurological and traumatic disorders Upper trapezius muscle open wound Shoulder joint disorder Shoulder and neck surgery Taking muscle relaxant drugs and rehabilitation therapy

Age

From **18 years** old to **50 years** old

Gender

Both

Phase

N/A

Groups that have been masked

- Participant
- Outcome assessor

Sample size

Target sample size: **30**

Randomization (investigator's opinion)

Randomized

Randomization description

For an equal number of samples in both groups, randomization is a block randomization method. The tool used in this method is "Random allocation software". In this software; the random sequence is determined by specifying the number of groups(2 groups), the type of groups (intervention and control), and the sample size.

Blinding (investigator's opinion)

Double blinded

Blinding description

Participants will not be aware of the allocation of study groups. Also, the sonography specialist, as an outcome assessor, will not be aware of the type of interventions and grouping of participants.

Placebo

Health conditions studied

1

Description of health condition studied

Chronic non-specific neck pain

ICD-10 code

G89.4

ICD-10 code description

Chronic pain syndrome

Primary outcomes

1

Description

Upper trapezius stiffness

Timepoint

Before and immediately after treatment

Method of measurement

By Elastography Mode of sonography device

Secondary outcomes

1

Description

Pain

Timepoint

Before and immediately after treatment

Method of measurement

Using Visual analog scale(VAS)

2

Description

Functional disability

Timepoint

Before and immediately after treatment

Method of measurement

By Neck disability index(NDI) questionnaire

Intervention groups

1

Description

Control group: The subject sits on a chair and the physiotherapist stands behind it. The physiotherapist asks the subject to hold the edge of the chair to prevent from ipsilateral shoulder moving. Then, subject's neck is bends to forward and sideways slowly in a pain-free range of movement and rotate to opposite side by physiotherapist. This condition is maintained for 60 seconds and will be repeated 3 times. The break between repetitions is 30 seconds.

Category

Rehabilitation

2

Description

Intervention group: The subject sits on a chair and the physiotherapist stands behind it. The physiotherapist asks the subject to hold the edge of the chair to prevent from ipsilateral shoulder moving. Then, subject's neck is bends to forward and sideways slowly in a pain-free range of movement and rotate to opposite side by physiotherapist. Next, The subject is asked to bend his or her head toward the involved side. While performing this exercise, the physiotherapist applies a small amount of resistance to his or her head and this resistance is maintained for 10 seconds. Then rest. Rest time is 30 seconds. This manual treatment will be repeated 3 times.

Title and more details about the data/document

Only part of the data, such as the original outcome information, the study protocol and statistical analysis can be shared.

When the data will become available and for how long

6 months after results publish

To whom data/document is available

Data will only be available to researchers working in academic and scientific institutes.

Under which criteria data/document could be used

If the research plan is intended to apply the therapeutic exercises used or the variables studied are similar to this study.

From where data/document is obtainable

executor of plan "Dr.Gholamhossein nassadj". E-mail: nassadj@yahoo.com

What processes are involved for a request to access data/document

By sending an email with a full explanation of the reason for requesting the documentation and the purpose of having it.
