The effectiveness of Low Level Laser Therapy in Discogenic Lumbar Radiculopathy; A Double Blind Randomized Controlled Clinical Trial

Protocol summary

Study aim

To determine the effectiveness of conventional physical therapy with and without Low Level Laser Therapy on pain, functional disability, ROM and Straight Leg Raise in patients with discogenic lumbar radiculopathy.

Design

Double Blind Randomized Controlled Trial with a parallel group design of 140 patients will have random allocation by Sealed Envelope Method.

Settings and conduct

Patients from the Physical Therapy Departments of Polyclinic, NIRM and Rawal hospitals, Islamabad Pakistan. The patients and outcome assessor will be kept blind during the whole trial regarding the treatment groups.

Participants/Inclusion and exclusion criteria

Inclusion Criteria □ Age group between 25- 50 years □ Both male and female patients □ Newly diagnosed cases of discogenic lumbar radiculopathy □ Patients with at least moderate score (21% - 40%) in Oswestry Disability Index □ Patients with positive SLR or Lasègue's test
Exclusion Criteria □ Patients receiving treatment by other methods for the last 3 months □ Lumbar spine surgery within the past year □ Spondylolisthesis □ Ankylosing spondylitis □ Cauda equina syndrome □ Any co-morbid diseases

Intervention groups

Patients will be randomly assigned to a treatment group by Sealed Envelope Method, either an Experimental Group (Low level Laser Therapy and Conventional Physical Therapy) or a Control Group (Conventional Physical Therapy alone). The treatment procedures for both groups will be repeated for 3 sessions per week for 6 weeks (18 sessions) and a follow up consultation over a maximum period of Four weeks. The readings will be taken for two times (Pre-Treatment and Post-Treatment) during the whole session.

Main outcome variables

□ Visual Analogue Scale for Pain Intensity. □ Dual Inclinator for L-ROM □ Oswestry Disability Index) for

Functional Disability □ Straight Leg Raise or Lasègue's Test for Lumbar Radiculopathy

Scientific title
The effectiveness of Low Level Laser Therapy in Discogenic Lumbar Radiculopathy; A Double Blind Randomized Controlled Clinical Trial

Public title
Low Level Laser Therapy in Discogenic Lumbar Radiculopathy

Purpose
Treatment

Inclusion/Exclusion criteria

Inclusion criteria:

Age group between 25- 50 years Both male and female patients Newly diagnosed cases of discogenic lumbar radiculopathy Patients with at least moderate score (21%-40%) in Oswestry Disability Index Patients with positive SLR or Lasegue's test

Exclusion criteria:

Patients receiving treatment by other methods like vapocoolants, dry needling, laser acupuncture, subdural steroid injections etc. for the last 3 months Lumbar spine surgery within the past year Spondylolisthesis Ankylosing spondylitis Vascular, neurological or rheumatic disorders Clinical evidence of any myelopathy or joint disorders Recent fracture of the lumbar vertebral spine Cauda equina syndrome Osteoporosis Clinical evidence of any tumor or any space occupying lesion. Any co-morbid diseases

Age
From **25 years** old to **50 years** old

Randomization (investigator's opinion)

Randomized

Randomization description

The patients will be allocated into two groups i.e. an Experimental Group and a Control Group by Randomization through Sealed Envelope Method. The Experimental Group patients will be treated with Low Level Laser Therapy along with Conventional Physical Therapy while those in the Control Group will be given Conventional Physical Therapy alone.

Blinding (investigator's opinion)

Double blinded

Blinding description

Participants and the outcome assessor will be kept blind. Allocation of patients into the Experimental and Control group will be random through Sealed Envelope Method.

Health conditions studied

1

Description of health condition studied

Lumbar disc herniation is a displacement / protrusion of disc material (nucleus pulposus or annulus fibrosis) beyond the intervertebral disc space. The prolapsed nucleus pulposus will often come in contact with the nearby spinal nerves, results in the compression of these nerves which in turn results in severe radicular pain. Herniated discs are the common cause of lower back pain (LBP), hip and leg pain. The onset of pain may begin suddenly or gradually after injury. Typically, the pain is located bilaterally at the posterior belt line. The pain pattern is usually referred rather than radicular with a sharp, shooting pain running down the lower back, buttocks and down the thigh along with numbness or tingling sensations. The pain is aggravated by prolonged sitting, standing, forward bending or twisting movements and is relieved by walking, lying down, rest and a recumbent position.

ICD-10 code

M54.16

ICD-10 code description

Radiculopathy, lumbar region

Primary outcomes

1

Description

Pain Intensity

Timepoint

At the start of treatment and then after 18 treatment

sessions for each patient.

Method of measurement

Visual Analogue Scale (VAS)

2

Description

Functional Disability

Timepoint

At the start of treatment and then after 18 treatment sessions for each patient.

Method of measurement

ODI (Oswestry Disability Index)

3

Description

Lumber Range of Motion

Timepoint

At the start of treatment and then after 18 treatment sessions for each patient.

Method of measurement

Dual Inclinator

Secondary outcomes

1

Description

Sciatic Nerve mobility

Timepoint

At the start of treatment and then after 18 treatment sessions for each patient.

Method of measurement

Straight Leg Raise or Lasegue's Test

Intervention groups

1

Description

Intervention group: Group-A of 70 patients will be treated with Low level Laser Therapy (LLLT) -830nm, 0.67 W/cm² or 300 mW/cm² at (Lumber-4,5 and Sacral-1 area) and Conventional Physical Therapy – McKenzie technique (1 set of 5 repetitions), Hot Pack (10 mins), Hold Relax with sustained stretch (1 set of 5 repetitions with 15 seconds hold), Sciatic nerve mobilizations in 1 set of 5 repetitions.

Category

Treatment - Other

2

Description

Control group: Group-B of 70 patients will be treated with Conventional Physical Therapy alone – McKenzie technique (1 set of 5 repetitions), Hot Pack (10 mins), Hold Relax with sustained stretch (1 set of 5 repetitions with 15 seconds hold), Sciatic nerve mobilizations in 1 set of 5 repetitions.
