Comparison of The Effectiveness of Family Care Based on Health Belief Model and Education of Health Promotion Lifestyle on illness Perception and Physical Symptoms in Asthma Patients.

Protocol summary

Study aim

Comparing the Effectiveness of Family Care Based on Health Belief Model and Teaching Health Promotion Styles on the Perception of Disease and Physical Symptoms in Patients With Asthma, as Well as Determining the Effectiveness of Family Care Education Based on Health Belief Model and Determining the Rate of Health Promotion Health on the Perception of Disease and the Physical Symptoms of Patients With Asthma.

Design

Controlled Clinical Trial, Not Blind, Randomized Design.

Settings and conduct

At the Fayazbakhsh Hospital, With the Presence of Dr. Jafari, an Asthma Specialist, the Patients' Files Were Reviewed and Interviewed. If Satisfied, Patients Complete the Questionnaires in Two Stages: Pre-Test and Post-Test. The Treatment Protocol is Performed in 8 Sessions on the Intervention Group at the Doctor's Clinic.

Participants/Inclusion and exclusion criteria

Inclusion Criteria: Age Between 40 and 60 Years; Diagnosis of Asthma and no Gender Restriction. Exclusion Criteria: Mental Disorders and Other Pulmonary Diseases.

Intervention groups

The Acceptance and Commitment Group Therapy Protocol (OCT) Will be Administered to the Experimental Group to Change Lifestyle, Health Beliefs, and Perceptions of Illness to Promote Health and Reduce the Physical and Psychological Symptoms of Asthma Patients, and the Control Group Will Continue Their Treatment Had.

Main outcome variables

The Main Implications of This Study are: In the Perception of Disease Questionnaire (Bradbot et al. 2006), and in the Lifestyle Questionnaire (Walker et al. 1987), to Improve Health and Reduce Physical and Mental Symptoms.

Sample size

Target sample size: **40**

Randomization (investigator's opinion)

Randomized

Randomization description

Based on the inclusion criteria and the performance of a pre-test session of 40 individuals who scored lower than the average after completing the Health Belief Forms Questionnaire and Health Promoting Styles Questionnaire and Illness Perception Questionnaire, they were selected by purposeful sampling. Since the study groups are equal in sample size, we use simple random allocation law, which is one of the limited randomization methods, and we divide the individuals into two intervention and control groups. We record patient data on 40 separate sheets and place the sheets inside the draw container and then randomly record 20 sheets out of the intervention group and place the remaining 20 sheets in the control group. To give. If there was a loss in treatment sessions, the sample size would be randomly eliminated in order to equalize the sample size, and eventually the number of subjects in both groups should be the same. Intervention group (n = 20) will have 8 sessions of 120 minutes acceptance and commitment therapy intervention and control group will not receive any intervention.

Primary outcomes**1****Description**

Short-Term Form of Disease Perception (Bradbent et al. 2006), Related to Health in Physical and Mental Symptoms.

Timepoint

At the Beginning of the Study (Before the Intervention) and After 8 Sessions of Group Therapy, Acceptance and Commitment.

Method of measurement

Short Scale of Disease Perception (Bradbent et al. 2006), Lifestyle Questionnaire with Health-Related Physical and Mental Symptoms.

Secondary outcomes

1

Description

Lifestyle Score (Walker et al. 1987) Related to Health in Physical and Mental Symptoms.

Timepoint

Scores of Health Promoting Lifestyle Questionnaires (Walker et al. 1987); Illness Perception (Bradbot et al. 2006); at Baseline (Before Intervention) and After Treatment Protocol Implementation.

Method of measurement

Short Form Perceptions Questionnaire (Bradbot et al. 2006); Health Promoting Lifestyle Questionnaires (Walker et al. 1987)

Intervention groups

1

Description

Intervention group: Acceptance and Commitment Therapy (ACT) has six central processes that lead to psychological flexibility. These six processes are: "Acceptance, Faulting, self as context, present-day communication, recognizing values and committed action Intervention group". In fact the purpose of Acceptance and Commitment therapy, is not to make a direct change in the client. Rather, its purpose is to help clientele communicate their experiences in different ways and be able to engage completely with meaningful, value-based life. The proposed protocol is based on the Acceptance and Commitment Book by Hayes, Straussell and Wilson. In the intervention group: There are 20 asthma sufferers who complete the Health Promoter Questionnaire (Walker et al., 1987) short-form questionnaires (Walker et al., 1987) before completing the protocol, with complete specifications. . In the intervention group, the Acceptance and Commitment Therapy protocol (ACT) will be conducted in eight consecutive 90-minute sessions in 4 consecutive weeks.

Category

Behavior

2

Description

Control Group: There are 20 Patients With asthma WHO Complete the Health Promoter (Walker et al. 1987) Shortlisted Test With a Complete List of Specifications in the Pre-Test Questionnaire. This Group has Routine Care For 4 Weeks and no Extra Work is Done on Them. After 4 Weeks, this Group Also Completes the Questionnaires After the Test.
