

Clinical Trial Protocol

Iranian Registry of Clinical Trials

28 Jul 2026

Comparison the effect of gait retraining along with feedback with rehabilitation targeting exercises on trunk and lower extremity kinetic and kinematic of patients with groin pain.

Protocol summary

Study aim

Comparison the effect of gait retraining along with feedback with rehabilitation targeting exercises on trunk and lower extremity kinetic and kinematic of patients with groin pain.

Design

The statistical population of the present study consists of men aged 18-35 with groin pain, among whom 48 people were selected based on the criteria for entering the research purposefully and randomly into two intervention groups and one control group (each group included 16 people) are divided. One group performs targeted rehabilitation interventions, and the other group undergoes gait retraining along with visual and verbal feedback. The control group also continues the special routine exercises of their sport.

Settings and conduct

The study was performed on footballers with groin pain in the Kharazmi University Correctional Laboratory. Squeeze test is used to evaluate the pain variable, and motion analysis systems are used to evaluate the kinetic and kinematic variables during a cutting maneuver. These assessments are pre and post test. In this research, the evaluator is kept blind, so that one researcher who has no knowledge of how to allocate subjects in groups, performs the evaluation.

Participants/Inclusion and exclusion criteria

Inclusion criteria: groin pain history; intention to return to competitive sports; positive Squeeze testing; painful touch on the adductor tendon. Exclusion criteria: hip joint osteoarthritis; primary medical conditions; pain in the thoracolumbar area; performing hip adductor strengthening exercises.

Intervention groups

Intervention Group 1: This group receives rehabilitation exercises at three levels. Intervention Group 2: This group receives a gait retraining program along with

visual and verbal feedback. Control group: This group continues the specific routine exercises of their sport.

Main outcome variables

Groin pain; Kinetic; Kinematic

General information

Reason for update

Scientific title

Comparison the effect of gait retraining along with feedback with rehabilitation targeting exercises on trunk and lower extremity kinetic and kinematic of patients with groin pain.

Public title

Comparison of gait retraining intervention along with feedback with rehabilitation targeting exercises on biomechanics of patients with groin pain.

Purpose

Treatment

Inclusion/Exclusion criteria

Inclusion criteria:

Men 18-35 years old have groin pain for at least 2 months People who intend to return to the same level of preinjury participation in competitive multidirectional sports Those who have a positive Squeeze test (at 45 degrees of hip flexion) Those who have painful palpation in the tendon of the adductor or its connections to the pubic bone

Exclusion criteria:

People with hip joint osteoarthritis Those with underlying medical conditions such as arthritis or infection People who feel pain in the thoracolumbar area Athletes who performed hip adductor strengthening exercises more than once a week for six months before the study

Age

Randomization (investigator's opinion)

Randomized

Randomization description

To randomize, the names of each subject are written on a ball after being selected and placed inside a bag, and a person is asked to take them out of the bag and randomly place 1: 1: 1 in one of three study groups.

Blinding (investigator's opinion)

Single blinded

Blinding description

One researcher who is evaluating the outcome is kept blind. In this way, he does not know how the subjects are assigned to the groups and what treatment interventions

each group of subjects receives. In this way, he does not make deliberate mistakes in his judgments and does not benefit from the new treatment intervention.

Intervention groups

1

Description

Intervention group 1: This group will implement a targeted rehabilitation protocol that includes three levels; level 1 addressed intersegmental control and strength, level 2 involved linear running mechanics and increasing linear running load tolerance, and level 3 targeted multidirectional mechanics and the transition back to high intensity sprinting. Exercises are performed 3 days a week, one day in between, for 8 weeks. The rest time between each set is 30 seconds to 1 minute.

Category

Treatment - Other

2

Description

Intervention group 2: This group performs gait retraining along with visual and verbal feedback. Gait retraining is done on a treadmill. People run on the treadmill at a comfortable pace in all sessions. Visual feedback during running through a full-length mirror that is placed directly in front of the treadmill, and verbal feedback in the form of instructions such as "keeping the knees in line with the toes, reducing pelvic prolapse and maintaining pelvic symmetry, reducing vertical acceleration (by inducing a quiet and quiet walking style)" provided by the tester. In general, the training time starts from 15 minutes in the first session and is increased to 3 to 9 minutes per week. While feedback time is reduced from 100% in the first four weeks to 25% in the last few weeks and then removed. Exercises are followed 1 day a week for 8 weeks.

Category

Treatment - Other

3

Description

Control group: This group continues the specific routine exercises of their sport.
