Investigation on the effects of Core stability and General exercise on functional activity in non-specific low back pain patients

Protocol summary

hajihhasani@sem-ums.ac.ir

Summary

Background: Low back pain is a common musculoskeletal disorder with a high prevalence, so that 85% of the population may experience it. Core Stability exercises has been recommended to improve neuromuscular skeletal system function in order to increase the protection of vertebral column and improve functional activities. Methods: Sixty patients (aged 18 to 30 years old) with chronic low back pain are randomly assign in one of two general exercise (GE, n=30) and core stability (CS, n=30) groups of this clinical trial. The protocol of intervention include 4 weeks (3 sessions in week) of designed exercise in each groups. The functional activities are measure before and after intervention.

Scientific title

Investigation on the effects of Core stability and General exercise on functional activity in non-specific low back pain patients

Public title

Effects of exercise therapy on activity in low back pain patients

Purpose

Treatment

Inclusion/Exclusion criteria

Inclusion Criteria: Non-specific low back pain patients; Aged 18 to 30 years old Exclusion Criteria: Neural. Skeletal, Muscular, cardiac, Vascular and Respiratory disease; Systematic disease; Spondylolssis and Spondylolystesis; Surgical treatment on Low back pain; Truma on Low back pain one week before intervention; Disc herniation; Polyneuropathy; Pregnancy

Age

From **18 years** old to **35 years** old

Gender

Both

Phase

N/A

Groups that have been masked

No information

Sample size

Target sample size: 60

Randomization (investigator's opinion)

Randomized
