Comparing the effectiveness of play therapy, storytelling and routine protocol on preoperative anxiety in preschool age children(3-6 years)

Protocol summary

Study aim

Comparison of the effectiveness of storytelling, play therapy and common hospital protocol on the severity of preoperative anxiety in children 3 to 6 years before and after the intervention

Design

A randomized clinical trial including a control group and non-blinded parallel groups was performed on 102 pre-school children (3 to 6 years) who were admitted to the hospital for a surgery. A simple random selection was employed using a table of random numbers to assign the children to one of the intervention group 1, group 2 and the control group. This process continued to the extent that the required sample size was attained in each group.

Settings and conduct

The current study was carried out at Golestan Hospital in Ahvaz. Children who were admitted for surgery selected according to the study criteria using a random allocation procedure. It should be noted that blinding was not performed.

Participants/Inclusion and exclusion criteria

Inclusion criteria: preschool children, parental consent, mental wellbeing, prior 12 months non-admission to hospital or surgery, no concomitant treatment with medications. Exclusion Criteria: lack of proper communication.

Intervention groups

Intervention group one: Play therapy was used in this group. According to the age and gender of the child, suitable toys were given to her/him to choose one or some of the toys based on their interests. This intervention lasted for about 20 minutes. Intervention group two: Storytelling was used in this group. According to the child's age and gender, some books were read to him/her by the researcher or child's parents for about 20 minutes. Control group: In this group the common hospital's protocol included the presence of child's parents and/or hospital personnel, and medication under

the supervision of the anesthesiologist was used.

Main outcome variables

level of anxiety before surgery of children

Scientific title
 Comparing the effectiveness of play therapy, storytelling and routine protocol on preoperative anxiety in preschool age children(3-6 years)

Public title
 Comparing the effectiveness of play therapy and storytelling on preoperative anxiety in preschool age children

Purpose
 Supportive

Inclusion/Exclusion criteria
Inclusion criteria:
 Children of pre-school age Parental informed consent
 Mentally health No admitted to hospital or surgery in pervious 12 months No concomitant drug treatment
Exclusion criteria:
 Inability to communicate properly

Age
 From **6 years** old to **12 years** old

Gender
 Both

Phase
 N/A

Groups that have been masked
No information

Sample size
 Target sample size: **102**
 Actual sample size reached: **97**

Randomization (investigator's opinion)
 Randomized

Randomization description
 In the current study, the children who were admitted to the hospital for a surgery and were representative of the inclusion criteria were selected using a simple random allocation strategy based on a table of random numbers. The procedure was as follows: a number was called from the table when a child patient was brought to the operating room. If the last digit of the randomly selected number was one of 1, 2 or 3, the candidate was assigned to the first intervention group (the storytelling group) and if the last digit of the number was one of 4, 5 or 6, the candidate had to enter the second intervention group (the play therapy group). Finally, if the last digit of the selected number was one of 7, 8 or 9, the nominated child was considered a control group participant (receiving routine treatments) and if the last digit was zero, another number had to be selected from the table.

Blinding (investigator's opinion)

Intervention groups

1

Description

Intervention group one: The intervention in this group was Play Therapy. After random selection the child is assigned to this group and by entering the operation room, the child is assessed by the researcher. While the

child is brought to the operation room on a stretcher or in a wheelchair, he/she is given the chance to pick toys based on his/her gender. For example, toys such as dolls and kitchen utensils or household objects were options for female participants, and a car, a cannon, a rifle, or a set of building blocks were available for the male participants to choose from and start playing. This intervention lasted for about 20 minutes under the supervision of the researcher.

Category

Behavior

2

Description

Intervention group two: The method of the intervention in group two was storytelling. After random selection the child is assigned to this group, then he/she is assessed by the researcher. While the child is brought to the operation room on a stretcher or in a wheelchair, some story books such as "Hassani" are chosen based on the gender of the child from a series of short stories. These stories were visually appealing to the children because of varied and colorful images. The content was also relevantly chosen to include areas like, education, health, nutrition, discipline, and social regulation training. These books were read by the researcher, but in the presence of the parents. If the child did not like it, though, the parents were given the books to read them to the child, under the researcher's supervision; this intervention also lasted for 20 minutes.

Category

Behavior

3

Description

Control Group: The Common Hospital Protocol was followed for the participants in this group. Midazolam was prescribed by the anesthesiologist, for the purpose of child's sedation, and if the child's anxiety was not relieved, thiopental sodium was used at sufficient doses to cause drowsiness and/or loss of consciousness. However, for the children who did not require sedation, only their parents or often a health care professional such as an anesthesiologist or an operating room specialist were permitted to accompany the child and stay.
