Evaluation Of The Effect of Using an instrument for Organizing Suture threads on Self-efficacy and Satisfaction of Scrub Person

Protocol summary

In this study, self-efficacy and satisfaction are examined in two groups.

Study aim

Determining of Evaluation Of The Effect of Using an instrument for Organizing Suture threads on Self-efficacy and Satisfaction of Scrub Person in Operating Room of Alzahra Hospital of Isfahan in 1398-99

Design

A clinical trial with a control group, with a parallel group, one-way, blind, randomized, on 44 staff members of the operating room scrub.

Settings and conduct

This study will be performed on staff in the role of scrub in Al-Zahra Hospital. The sampling method is first available (easy) and then randomly assigned to the control and intervention groups. In the control group, routine method and in the intervention group, an instrument are used for maintenance and arranging surgical sutures. Then, the effect of the independent variable "Using an instrument for Organizing Suture threads" on the dependent variable of "self-efficacy" and "satisfaction" is evaluated. data analyzers are kept blind.

Participants/Inclusion and exclusion criteria

Entry requirements: Training the scrub person to use the tool, working in the fields of general surgery, vascular, neurology, orthopedics, pediatrics, cosmetics, ENT and gynecology, using the method of arranging surgical sutures in at least 3 surgeries and in surgeries that more than 3 surgical sutures have been Opened. No entry conditions: Using a method other than the routine method and other than the tools for organizing surgical sutures

Intervention groups

Control group: Scrub persons who will use the routine method of organizing surgical sutures. The routine method of arranging surgical sutures is to place the surgical sutures after each use, on the surgical table or on a gas to arrange the surgical sutures and make them available. Intervention group: Scrub persons who will use a surgical instrument for organizing Suture threads.

Scientific title
Evaluation Of The Effect of Using an instrument for Organizing Suture threads on Self-efficacy and Satisfaction of Scrub Person

Public title
The Effect of Using an instrument for Organizing Suture threads on Self-efficacy and Satisfaction of Scrub Person

Purpose
Other

Inclusion/Exclusion criteria

Inclusion criteria:

Participants in the project, including the scrub person in the intervention group, have received the necessary training to use the tool. The scrub person should work in the fields of general , vascular, neurological, orthopedic, pediatric, cosmetic, ENT and gynecology surgery. The scrub person should scrub in surgeries that have more than 3 surgical sutures on the operating table. The scrub person should use the method of organizing surgical sutures in at least 3 surgeries.

Exclusion criteria:

Lack of willingness of the surgical team to continue cooperation in research. Operating room personnel not be present in the operating room during the study for any reason, such as parental leave, etc. Using an other method except the routine method and except the tools of organizing surgical threads for maintaining and arranging surgical threads.

Age
No age limit

Gender

Groups that have been masked

- Data analyser

Sample size
Target sample size: **44**

Randomization (investigator's opinion)
Randomized

Randomization description
Prior to the intervention, 44 staff members of Al-Zahra Hospital operating room will enter the study according to their inclusion criteria. These 44 operating room staff will then be assigned random numbers 1 to 44, and they will be randomly assigned (even and odd numbers) in two intervention group (22 people) and control group(22 people). Accidental sampling is done by randomly assigning them to numbers 1 to 44 and placing them in two groups based on even and odd. The control group will use the routine method of organizing surgical sutures. The routine method of arranging surgical sutures is to place the surgical sutures after each use, on the surgical table or on a gas to arrange the surgical sutures and make them available.The intervention group will use the tools to arrange the surgical sutures.

Blinding (investigator's opinion)
Single blinded

Blinding description
The data analyzer is kept blind. After collecting the data in the intervention and control groups, the data was provided to the analyzer and he did not know the type of intervention and the randomization and placement of samples in the groups. .

Intervention groups

1

Description

Intervention group: The operating room staff is in the role of scrub who use the tools of organizing surgical sutures. After randomization, and placing the samples in the intervention and control groups, the intervention group will use the surgical suture arrangement tool. The test group will be taught how to use the tool. Before and after the intervention, the self-efficacy questionnaire was completed by the experimental group; A questionnaire of satisfaction with the method of arranging surgical sutures will be given to the experimental group after the intervention. Then the data entered by statistical software Spss version 16 will be analyzed using descriptive and analytical tests.

Other

2

Description

Control group: The operating room staff is in the role of scrub who use the routine method to arrange the surgical sutures. The routine method involves holding the surgical sutures on a sterile gauze on the operating table or on the operating table. Before and after the intervention, the self-efficacy questionnaire is completed by the control group. A questionnaire of satisfaction with the method of arranging surgical sutures will be given to the control group after the intervention. Then the data entered by statistical software Spss version 16 will be analyzed using descriptive and analytical tests.
