

Clinical Trial Protocol

Iranian Registry of Clinical Trials

28 Jun 2026

Comparison of therapeutic effects of hemoperfusion in intubated and non-intubated patients with respiratory failure caused by the COVID-19

Protocol summary

Study aim

Determination of therapeutic effects of hemoperfusion in intubated and non-intubated patients with respiratory failure caused by the COVID-19

Design

Clinical trial with one intervention group, with no control group and no blindness on 40 hospitalized patients with severe forms of COVID-19.

Settings and conduct

This nonrandomized with no blindness clinical trial will be performed in Loghman Hakim Hospital on patients after obtaining permission from the ethics committee on patients with respiratory failure caused by the COVID-19, who are on antiviral medication according to national protocol. Patients will be divided into two groups; intubated and non-intubated. Intervention group will be treated with hemoperfusion. Laboratory and clinical finding will be evaluated. The data will be analyzed by SPSS software.

Participants/Inclusion and exclusion criteria

The participants are hospitalized patients with severe forms of COVID-19. Inclusion Criteria: Patients with diagnosis of COVID-19 based on the clinical manifestations, lung CT-scan, testing of pharyngeal sample using real-time PCR and the physician's diagnosis; Patients who have SpO₂ less than 85%, and no improvement has been achieved despite 48 hours of standard treatment. Exclusion Criteria: Plasma platelets count less than 30000 per microliter; Multiple organ failure

Intervention groups

Intervention group: 40 eligible patients with severe COVID-19 in a 1:1 ratio: (20 intubated and 20 non-intubated)hemoperfusion + Standard of care treatment

Main outcome variables

O₂ Saturation CRP Ferritin Vasopressor need Length of hospital stay Mortality
