

Clinical Trial Protocol

Iranian Registry of Clinical Trials

17 Sep 2026

Evaluation of the effect of crocin on macular, peripapillary and optic nerve head blood flow in healthy individuals using coherence tomography optical angiography (OCTA)

Protocol summary

Study aim

The goal of this study is to perform a double blinded clinical trial to evaluate the therapeutic effect of crocin on macular, peripapillary and optic nerve head blood flow.

Design

This is a double blinded randomized clinical trial with two-arm parallel group. The crocin and placebo tablets are made in similar shape, color, and size. The macular, peripapillary and optic nerve head blood flow will be determined before and two hours after taking two tablets of crocin or placebo.

Settings and conduct

Study will be done in Khatam-al-Anbia Hospital under the supervision of specialist. Tablets will be prepared from pure crocin in Mashhad Pharmacy School. In this double blinded trial physician, participants and researchers will not aware of the pill contents. After selecting the participants they will be randomly divided into crocin or placebo groups. The macular, peripapillary and optic nerve head blood flow will be determined before and two hours after taking two tablets of crocin or placebo.

Participants/Inclusion and exclusion criteria

The age between 20 and 50
Lack of systemic disease such as diabetes and hypertension
Not using systemic drugs
Lack of any intraocular pathology
No history of eye surgery

Intervention groups

Healthy people who their retinal blood flow are examined before and 2 hours after receiving two crocin tablets (15 mg).
Placebo group: Healthy people who their retinal blood flow are examined before and two hours after receiving two placebo tablets.

Main outcome variables

Macular blood flow
Peripapillary blood flow
Optic nerve head blood flow

Scientific title

Evaluation of the effect of crocin on macular, peripapillary and optic nerve head blood flow in healthy individuals using coherence tomography optical angiography (OCTA)

Public title

The effect of crocin on retinal arteries

Purpose

Treatment

Inclusion/Exclusion criteria**Inclusion criteria:**

The age of the volunteer should be between 20 and 50
Lack of systemic disease such as diabetes and hypertension
Do not use systemic drugs
Lack of any intraocular pathology
No history of eye surgery

Exclusion criteria:

Any eye disease
Age less than 20 or more than 50
History of eye surgery

AgeFrom **20 years** old to **50 years** old**Gender**

Both

Phase

2

Groups that have been masked

- Participant
- Care provider
- Investigator
- Outcome assessor
- Data analyser

Sample sizeTarget sample size: **40****Randomization (investigator's opinion)**

Randomized

Randomization description

four-digit numbers, obtained from "random number table", will be applied for coding of tablet containers and randomization. First column of the random number table will be assigned to crocin group and the second one to placebo. The codes will be written on a piece of paper and put into an opaque envelope. The envelopes will be sealed and placed sequentially in a box and kept by researcher and physician. Envelopes and their code will be assigned sequentially to eligible participants in order of their arrival time.

Blinding (investigator's opinion)

Double blinded

Blinding description

Crocine and placebo tablets will be prepared in a similar shape, color, and size, stored in a dark container and coded by a pharmacist. The physician, researcher, and participants will not be aware of the content of the pills inside the container.

Health conditions studied**1****Description of health condition studied**

The blood flow of the macula, peripapillary and head of optic nerve

ICD-10 code**ICD-10 code description****Primary outcomes****1****Description**

Macular blood flow

Timepoint

Before the intervention and two hours after taking 2 tablets of 15 mg crocin or placebo

Method of measurement

Coherence Optical Tomography Angiography (OCTA)

Secondary outcomes**1****Description**

blood flow of peripapillary and optic nerve head

Timepoint

Before the intervention and two hours after taking two tablets of crocin or placebo

Method of measurement

Coherence Optical Tomography Angiography (OCTA)

Intervention groups

1

Description

Intervention group: Two crocin tablets (15 mg) will be given into healthy participants in the project. Optical coherence tomography (OCT) imaging with angiography will be done before and after two hours of crocin administration.

Category

Treatment - Drugs

2

Description

Control group: Two placebo tablets will be given into healthy participants in the project. Optical coherence tomography (OCT) imaging with angiography will be done before and after two hours of placebo administration, .
