Iranian Registry of Clinical Trials

27 Jun 2026

The effects of progressive resistance strength training on body mass index, quality of life and functional capacity in knee osteoarthritis

Protocol summary

Study aim

The aim of this study is to investigate the effectiveness of progressive resistance strengthening training on body mass index, quality of life and functional capacity in the overweight and obese knee osteoarthritis patients.

Design

Study will be single-blinded randomized controlled design

Settings and conduct

Study will be conducted at the Teaching Bay of Rehmatul-Lil-Alameen Postgraduate institute of cardiology, Punjab Employees Social Security Institution. The principle investigator will not be blinded. The participants receiving the intervention will be blinded by simply not informing them of their treatment allocation.

Participants/Inclusion and exclusion criteria

The inclusion criteria will be: (1) Overweight and obese knee osteoarthritis patients having osteoarthritis of one or both knees (2) Osteoarthritis grading scale of 2-mild or 3-moderate according to Kellgren and Lawrence radiographic scale (3) Symptoms of osteoarthritis for more than three months (5) Residing in the Urban community of Lahore . Exclusion criteria will be one or more of the following: (1) Flat feet (2) Knee surgery (3) Corticosteroid injection of knee (4) Spinal deformities (5) Cardiac problem or (6) Hormonal problem

Intervention groups

Intervention groups will be Rehabilitation Protocol Group and the Control Group. The patients in the Rehabilitation Protocol Group will perform the progressive resistance strengthening training in non-weight bearing sitting and lying positions following the instructions of daily care for duration of 12-weeks. The patients in the Control Group will follow the instructions of daily care for duration of 12-weeks.

Main outcome variables

Primary outcome measures will be body mass index and quality of life. Secondary outcome measure will be the functional capacity.

Scientific title

The effects of progressive resistance strength training on body mass index, quality of life and functional capacity in knee osteoarthritis

Public title

The role of strength training in treatment of knee osteoarthritis

Purpose

Treatment

Inclusion/Exclusion criteria**Inclusion criteria:**

Overweight and obese knee osteoarthritis patients having osteoarthritis of one or both knees Osteoarthritis grading scale of 2-mild or 3-moderate according to Kellgren and Lawrence radiographic scale Symptoms of osteoarthritis for more than three months Residing in the Urban community of Lahore

Exclusion criteria:

Flat feet Knee surgery Corticosteroid injection of knee Spinal deformities Cardiac problem Hormonal problem.

Age

From **45 years** old to **60 years** old

Groups that have been masked

- Participant
- Care provider
- Outcome assessor
- Data analyser
- Data and Safety Monitoring Board

Sample size

Target sample size: **56**

Randomization (investigator's opinion)

Randomized

Randomization description

The study will be single blinded randomized controlled design. The method of allocation generation will be done by a computerized random-number generator. The sequence will be generated by the process of simple randomization. Simple randomization will be based on a single sequence of random assignments. Three research coordinators will be involved in data collection. The one coordinator will be involved in baseline data collection and two coordinators will be involved in the assessment of outcomes. Participants will be blinded of other groups intervention.

Blinding (investigator's opinion)

Single blinded

Blinding description

The coordinators collecting data will be independent individuals from trials and will be unaware of the group allocation. There will be different coordinators at the initial and final evaluation. Individuals performing the statistical analysis will be blinded by labelling the groups with non-identifying terms (such as X and Y).

Body Mass Index

Timepoint

At pre-test and post-test (after 12-weeks of intervention) measurements

Method of measurement

Calculated by the formula Weight (kg)/Height(meter square)

2**Description**

Quality of life

Timepoint

At pre-test and post-test (after 12-weeks of intervention) measurements

Method of measurement

Western Ontario and McMaster Universities Osteoarthritis Index summary score of pain, stiffness and physical function

Secondary outcomes

ms.raic@pessi.gop.pk

1

Description

Functional capacity

Timepoint

At pre-test and post-test (after 12-weeks of intervention) measurements

Method of measurement

Gait Speed Test will be used for the assessment of functional capacity

Intervention groups

1

Description

Intervention group: The participants in the intervention group will perform the training sessions of progressive resistance strength training of lower limb muscle groups following the instructions of daily care for duration of 12-weeks. Each training session started with 10 minutes warm up, 45-60 minutes of progressive resistance strength training of lower limb muscle groups training, and 10 minutes cool down at the end of training session.

Category

Treatment - Other

2

Description

Control group: The participants in the control group will follow the instructions of daily care for duration of 12-weeks. Instructions of daily care are general guidelines of eating and care of knee in order to prevent the cartilage destruction.
