Effects of kangaroo mother care on the level of bilirubin in the newborn after cesarean and maternal satisfaction from care after birth

Protocol summary

Summary

The purpose of this study was determine effects of kangaroo mother care on level of bilirubin newborns after cesarean and satisfaction mothers from care after birth. The study is single blind. The samples were placed randomly in two groups control and intervention. The study population included mothers and infants from cesarean delivery admitted in the women surgical ward of Fatima Hospital in the City Miyandoab. Inclusion criteria newborns were term, cesarean delivery, and mothers criteria receive spinal anesthesia. If during study the newborns have respiratory distress or pathological jaundice will be excluded. Mother use antidepressants or drug, have a history prior experience kangaroo mother care, diabetes and hypertension will be excluded. The number of samples is fifty eight for each group. The intervention group infants received kangaroo mother care immediately after birth, and this act repeated at hours 7, 13 and 19 later days, and control group infants receive routine care. Bilirubin both groups of babies at birth, 24 hours, 36 hours and the fifth day after birth from the forehead with Billy Check control and will compared. Mother's both groups receive satisfaction questionnaire from care after birth on the discharge day from hospital (third day), and will compare. The intervention group mothers receive experience questionnaire from kangaroo mother care and will compare. Bilirubin levels considered in newborns as the primary outcome.

Description of health condition studied

Kangaroo mother care

ICD-10 code

Z39.0

ICD-10 code description

Care and examination immediately after delivery

Primary outcomes

1

Description

The amount of bilirubin

Timepoint

Immediately after birth, 24 hours after birth, 36 hours after birth, 5 days after birth

Method of measurement

With using from Billy Check (K-J-8000 model, made in Chin)

Secondary outcomes

1

Description

Mothers satisfaction from care after birth

Timepoint

Mothers discharge day from hospital

Method of measurement

Questionnaire

2

Description

The mothers experience of kangaroo mother care

Timepoint

Mothers discharge day from hospital

Method of measurement

Questionnaire

Intervention groups

1

Description

The control group after mother exit of the operating room will be receive routine care in recovery room. Newborns baseline bilirubin will controlled through forehead skin after birth with Billy Check (K-J-8000 model, made in China). Twenty-four and thirty-six hours and fifth day after birth neonatal bilirubin will be control and recorded again. On the third day postpartum mothers' satisfaction will be measured through questionnaires

Description

The intervention group before mothers transfer to the operating room will be trained about kangaroo mother care for 30 minutes. Newborns baseline bilirubin will controlled through forehead skin after birth with Billy Check (K-J-8000 model, made in China). The this group babies will be placed between mother's breasts immediately after birth in the recovery room. With blanket will be kept warm and dry, and a hat will be placed on baby's head to prevent heat loss. Appropriate position will be given to mother with folding bed or pillows. Kangaroo mother care will continue for 30 minutes. This position will be continued time mother transfer to surgery ward. Kangaroo mother care will be continued in the ward after transfer three times a day, each time for 30 minutes at hours 7, 13 and 19 until discharge. Curtain will help to privacy during kangaroo mother care. The baby's bilirubin will be controlled with Billy Check from forehead skin at hours 24, 36 after birth and fifth day, and will be recorded. Two questionnaires will be giving to the mothers on the third day. Maternal satisfaction from postpartum care and their experiences of kangaroo care will be measured on the third day after birth
