Success rate of laryngeal mask placement in children using one-way jaw lifting method on oxygenation status during general anesthesia

Protocol summary

Study aim

Success rate of laryngeal mask placement in children using one-way jaw lifting method on oxygenation status during general anesthesia

Design

This study is a randomized clinical trial with control and intervention groups in which the groups are parallel; In this study, 30 children will be randomly divided into two groups and there will be no blinding in the study.

Settings and conduct

In this study, blindness will not be performed and patients, including children aged 2 to 10 years, in the Children's Hospital (Tabriz) after random assignment to control and intervention groups, will be subjected to LMA implantation in two classic methods and unilateral jaw lift. .

Participants/Inclusion and exclusion criteria

Inclusion criteria include: non-emergency surgery candidate and exclusion criteria include: congenital anomalies, cleft palate, patients in need of emergency surgery, patients with gastrointestinal problems.

Intervention groups

For patients in the control group (classic LMA implantation by classical method) will be performed by a skilled anesthesiologist and for patients in the intervention group (unilateral jaw raising, anesthesiologist with unilateral maneuvering maneuver) will perform LMA implantation.

Main outcome variables

The use of LMA placement for mechanical ventilation of ginseng is anesthesia and in this study, a new method will be introduced to improve ventilation and oxygenation.

Treatment

Inclusion/Exclusion criteria

Inclusion criteria:

Candidate for non-emergency surgery

Exclusion criteria:

Congenital anomalies Cleft palate Patients in need of emergency surgery Patients with digestive problems

Age

From **2 years** old to **10 years** old

Gender

Both

Phase

2-3

Groups that have been masked

No information

Sample size

Target sample size: **30**

Randomization (investigator's opinion)

Randomized

Randomization description

All participants will be randomly divided into two modes of intervention and control with the help of online statistical software (www.randomizer.org). In this method, a profile will be designed for the study and the people who will enter the study will be written in the people participating in the study and the software will randomly enter that person in one of the two intervention or control groups.

Blinding (investigator's opinion)

Not blinded

Intervention groups

1

Description

Intervention group: After induction of anesthesia and the right time to insert the LMA, the left hand lifts the lower jaw from one side by performing a JT maneuver, then puts the laryngeal mask in the mouth and pushes it down, and after confirming that it is fixed in place. Proves.

Category

Treatment - Devices

2

Description

Control group: Embedding LMA in this group will be a classic method. The anesthetized patient's head is extended with one hand and the proximal part of the LMA is held in the hand and enters the patient's mouth with the slit surface toward the base of the tongue, then pushed down until resistance is felt. Don't be. The dominant hand is then pushed with the finger guide. Before removing the finger from the patient's mouth, remove the non-dominant hand from under the patient's head and hold the LMA so that it does not move, and then we will fix it.
