Effect of aerobic exercise and short-term coenzyme Q10 supplementation on on serum total antioxidant capacity, malondiadehyde and creatine kinase in male non-athletes.

Protocol summary

Summary

The purpose of the present study is to investigate the effect of aerobic exercise and short-term Coenzyme Q10 supplementation on serum total antioxidant capacity (TAC), cellular damage and malondiadehyde (MDA) in male non-athletes. Twenty healthy male volunteer non-athletes (aged 22-28 years) in a randomized, double-blind design will be allocated in two equal groups to receive supplement (2.5 mg/kg/day Coenzyme Q10) or placebo (2.5 mg/kg/day dextrose) groups. After the supplementation period (14 days), all subjects will participate in an aerobic exercise protocol with 75% VO2max on the treadmill for 30 minutes. Blood samples will be obtained before the Q10 supplementation along with before and after the exercise protocol. The serum total antioxidant capacity (TAC) and Malondialdehyde (MDA) along with biochemical profiles will be measured by FRAP and spectrophotometer, respectively. The hematologic, creatine kinase and lactate changes will be determined by automatic analyzer. The normal data will analyzed by repeated measure ANOVA, Bonferroni and independent t test at $\alpha \leq 0.05$.

Scientific title

Effect of aerobic exercise and short-term coenzyme Q10 supplementation on on serum total antioxidant capacity, malondiadehyde and creatine kinase in male non-athletes.

Public title

Coenzyme Q10 and aerobic exercise effect on oxidative damages

Purpose

Basic scienece

Inclusion/Exclusion criteria

Inclusion criteria: Healthy male non-athletes, age 22-28

years, without any exercise training and inflammatory or oxidative supplement ingestion during 6 months prior to the study. Exclusion criteria: chronic diseases, injuries, aerobic power higher than 55ml/kg/min, fat percent lower than 10%.

Age

From **22 years** old to **28 years** old

Gender

Male

Phase

N/A

Health conditions studied**1****Description of health condition studied**

Exercise-induced Oxidative damages

ICD-10 code

Y57.9

ICD-10 code description

Drug or medicament, unspecified

Primary outcomes**1****Description**

Serum Total antioxidant capacity (TAC)

Timepoint

14 days after the initiation of the intervention

Method of measurement

by Frap Method

2**Description**

Serum Malondialdehyde

Timepoint

14 days after the initiation of the intervention

Method of measurement

by thiobarbituric acid reactive substance (TBARS) and spectrophotometer

3**Description**

Creatine Kinase Activity

Timepoint

14 days after the initiation of the intervention

Method of measurement

by automatic analyzer and spectrophotometer

Secondary outcomes**1****Description**

Plasma Lactate

Timepoint

14 days after the initiation of the intervention

Method of measurement

by automatic analyzer .

2**Description**

Peripheral blood leukocytes counts

Timepoint

14 days after the initiation of the intervention

Method of measurement

It will determine by automatic analyzer

3**Description**

Maximal Oxygen Consumption

Timepoint

14 days after the initiation of the intervention

Method of measurement

by Bruce treadmill protocol

Intervention groups

1

Description

After 14-days supplementation, Placebo group (2.5 mg/kg/day Dextrose), will participate in an aerobic exercise protocol with 75% VO2max on the treadmill for 30 minutes.

Category

Placebo

2

Description

After 14-days supplementation, supplement group (2.5 mg/kg/day Coenzyme Q10), will participate in an aerobic exercise protocol with 75% VO2max on the treadmill for 30 minutes.

Category

Treatment - Drugs
