Effect of Aloe Vera gel versus control group the severity of pain and improvement of lower limb ulcers in non-diabetic patients undergoing open-heart surgery: a single-blind randomized clinical trial

Protocol summary

Study aim

To assess the effect of Aloe vera gel versus control group the severity of pain and improvement of lower limb ulcers in non-diabetic patients undergoing open-heart surgery

Design

This is a single-blind randomized clinical trial, phase II, in which the right and left sides of 35 eligible patients will be randomly assigned to the intervention and control groups

Settings and conduct

The eligible diabetic patients undergoing open-heart surgery referring to the Chamran Hospital in Isfahan city during the study period will be enrolled in the trial and right and left sides of patients will be randomly assigned to the intervention and control groups through the drawing of lots. This trial will be single-blinded so that the physician examining the patients will not be aware of the intervention.

Participants/Inclusion and exclusion criteria

Inclusion criteria: Age of 18 to 80 years, Open heart surgery, Preparing graft from saphenous veins on both legs, Exclusion criteria: Emergency open-heart surgery, Diabetes, Skin disease, Vascular disease, Sensitivity to Aloe vera, Chronic renal disease, Wound infection

Intervention groups

Intervention group: The surgical wound washing with normal saline and rubbing Aloe Vera gel and sterile dressing once a day for 5 days. Control group: The surgical wound washing with normal saline and sterile dressing once a day for 5 days.

Main outcome variables

The severity of surgical wound pain; the improvement of surgical wound

- Outcome assessor

Sample size

Target sample size: **35**

Randomization (investigator's opinion)

Randomized

Randomization description

Random assignment of the right and left sides of the patients to the intervention and control groups through the drawing of lots. To do this, we prepare two sheets and write "right" on one sheet and "left" on another. Then, by referring to every patient, one of the sheets will be randomly taken. According to whether the sheet is taken right or left is assigned to the intervention group and the other side to the control group.

Blinding (investigator's opinion)

Single blinded

Blinding description

The physician who will examine the patients will not be aware of the intervention. Thus, the trial will be run as single-blind

Health conditions studied**1****Description of health condition studied**

Surgical wound of saphenous veins

ICD-10 code

S75.2

ICD-10 code description

Injury of greater saphenous vein at hip and thigh level

Primary outcomes**1****Description**

The severity of surgical wound pain

Timepoint

On the first, forth, seventh, and fourteenth days

Method of measurement

Using Visual Analog Scale (VAS)

2**Description**

The improvement of surgical wound

Timepoint

On the first, forth, seventh, and fourteenth days

Method of measurement

Using Reeda Scoring tool

Secondary outcomes

empty

Intervention groups**1****Description**

Intervention group: The surgical wound washing with normal saline and rubbing Aloe Vera gel and sterile dressing once a day for 5 days.
