

Clinical Trial Protocol

Iranian Registry of Clinical Trials

16 Sep 2026

Evaluation of the effect and side effects of topical glucosamine in the treatment of patients with plaque psoriasis

Protocol summary

Study aim

Evaluation of the possible therapeutic efficacy of topical glucosamine in patients with plaque psoriasis

Design

A double-blind randomized clinical trial with 30 eligible patients were randomly assigned to the R group (Right side as treatment) and the L group (Left side as treatment)

Settings and conduct

Patients with chronic plaque psoriasis who referred to the dermatology department of Imam Reza Hospital in Mashhad during the study were included in the study if they were eligible and were randomly assigned to the right and left groups of the body. This study was performed double-blindly so that patients and physicians did not know the type of intervention.

Participants/Inclusion and exclusion criteria

Inclusion criteria: Patients of older than 18 years, Patients with plaque psoriasis Exclusion criteria: Use of any topical or oral medication affecting the course of the disease in the last three months, Irregular attendance for visits, Occurrence of any complications

Intervention groups

30 patients of plaque psoriasis who indicated for topical treatment were enrolled in the study after declaring informed consent. The patient received glucosamine and placebo ointment and advised to use twice daily on every side of the body and totally be used for 8 weeks.

Main outcome variables

Despite a continuous reduction in modified PASI score in both groups, no significant differences were observed between the topical drug and the placebo

Sample size

Target sample size: **30**

Actual sample size reached: **14**

Randomization (investigator's opinion)

Not randomized

Randomization description

Blinding (investigator's opinion)

Double blinded

Blinding description

Due to the similarity of the placebo and the main drug, patients will not be informed of the type of intervention. On the other hand, the examining physician does not have information about the main characteristics of the patient and the type of intervention during the examination, and only the symptoms are examined and reported with numerical codes. Therefore, the study will be conducted double-blindly.
