

Clinical Trial Protocol

Iranian Registry of Clinical Trials

19 Jul 2026

effect of a short-term resistance training course on some inflammatory markers of overweight menopausal women

Protocol summary

Study aim

The purpose of this study is to investigate the effect of 4 weeks of resistance training on some inflammatory markers in sedentary postmenopausal middle-aged women

Design

The study is a randomized clinical trial with control group. 24 obese women (45-55 years, Body mass index 25-35) will be selected through purposive sampling and will randomly be divided into two intervention and control groups

Settings and conduct

The present field study is semi-experimental which will be done in a Islamic azad university gym. A professional coach will train the subjects and a lab technician will take their blood samples. blood sample will be analyzed in the university lab.

Participants/Inclusion and exclusion criteria

Inclusion criteria; 45-55 years old women; Body mass index between 25-35. Exclusion criteria: metabolic disorder

Intervention groups

Intervention group will do resistance training 3 sessions per week for 4 weeks. Control group will not participate in any exercise.

Main outcome variables

CRP-ESR

General information

Reason for update

according to ethnic committee certification the word of "sedentary" in title should be changed to overweight as it is showed in below: effect of a short-term resistance training course on some inflammatory markers of overweight menopausal women

Intervention groups

1

Description

Intervention group: 12 obese women (45-55 years, BMI 25-35) will participate in this research as intervention group. They will do resistance training 3 sessions per week for 4 weeks. Each exercise session includes 3 workout cycles including 12 stations and 8 to 10 repetition of practice in each station. These stations, respectively, include chest press, leg extension, leg flexion, Underhand Cable Pull downs, Barbell Shoulder Press, Barbell Curl, Barbell Triceps, Leg Press, cross with dumbbells, sit-ups, squat, and Barbell incline Bench Press. In the first week, the intensity of the exercise will be 50% of maximum repeat, and in the next weeks, the intensity increase to 85% of maximum repeat. Body mass index measurement and blood sampling will be done in fasting, 24 hours before and 48 hours after the exercise

Category

N/A

2

Description

Control group: control group will be asked not to participate in any exercise program and keep on their regular diet during research and report any changes in their life like disease, serious stress
