Comparison of the Effect of Aromatherapy and Distraction on the Pain Caused by Venipuncture in Hospitalized Children

Protocol summary

Study aim

Evaluation and comparison of the effect of aromatherapy and distraction on the Pain Caused by Venipuncture in children admitted to the pediatric ward of Ali ebne Abitaleb Hospital in Zahedan in 1398

Design

Clinical trial with two control groups and one intervention group, community-based and pragmatic, with parallel groups without blinding, randomized, on 90 patients, permutation of permutation modes A, 2 and 3 is used for randomization.

Settings and conduct

Children aged 3-8 years admitted to the pediatric ward of Ali ebne Abitaleb Hospital are randomly divided into three groups (two intervention groups and a control group). In the distraction group, the researcher uses a red hat puppet to talk and play with the child 3 minutes before the venipuncture begins (puppetry). In the aromatherapy group, the child inhales a handkerchief soaked in lavender essential oil attached to the collar of his shirt 20 minutes before the start of the vein. In the control group, only the severity of the child's pain after venipuncture was measured and no intervention was performed.

Participants/Inclusion and exclusion criteria

Inclusion criteria: Age range 3 to 8 years Family and child consent to participate in the study Non-Inclusion criteria: Children with asthma or allergies to aromatherapy Suffering from mental retardation Take painkillers before venipuncture Inability to communicate or lack of full consciousness

Intervention groups

In the distraction group, the researcher moves the red hat with the doll's hand and speaks and plays with the child in the language of the doll. In the aromatherapy group, the child inhales the lavender essential oil poured on a napkin attached to the collar of his shirt. In the control group, only pain was measured and no intervention was performed.

Main outcome variables

The amount of pain

Scientific title

Comparison of the Effect of Aromatherapy and Distraction on the Pain Caused by Venipuncture in Hospitalized Children

Public title

Comparison of the effect of aromatherapy and distraction on pediatric venipuncture pain

Purpose

Supportive

Inclusion/Exclusion criteria**Inclusion criteria:**

Age range 3 to 8 years Family and child consent to participate in the study

Exclusion criteria:

Children with asthma or allergies to aromatherapy Suffering from mental retardation Receive painkillers before venipuncture Inability to communicate or lack of full consciousness

Age

From **3 years** old to **8 years** old

Gender

Both

Phase

N/A

Groups that have been masked*No information***Sample size**

Target sample size: **90**

Randomization (investigator's opinion)

Randomized

Randomization description

Samples with non-probability method available (easy) are selected from the pediatric ward of Ali Ibn Abitaleb Hospital in 1398 and meet the inclusion criteria. The samples are also assigned to the groups by permutation-class randomization method so that in addition to randomization of individuals between groups, they are also matched in terms of gender and age. There are three groups in this intervention. One control group, 2 aromatherapy groups and 3 doll groups. There are 6 permutations for numbers 1 to 3. Each case is assigned a number from 1 to 6, and by using the lottery until the sample size is completed, different permutation modes are selected and classified into groups based on being a boy or a girl and age under 5 years or over 5 years.
