The effect of vitamin D injection on tumor necrosis factor alpha (TNF) and vascular cell adhesion molecule 1 (SVCAM-1) in vitamin D deficient patients with Type 2 Diabetes

Protocol summary

Study aim

The aim of this study was to determine the effect of vitamin D injection supplement on tumor necrosis factor-alpha and the soluble form of vascular cell adhesion molecule 1 in patients with type 2 diabetes with vitamin D deficiency.

Design

A clinical trial with a control group, with parallel groups, double-blind, randomized, phase 1-2 was performed on 50 patients. Random computer-derived random codes (random allocation table) were used for randomization.

Settings and conduct

This study was performed on patients with diabetes, with vitamin D deficiency who refer to the Diabetes Center of Yazd city. The researcher and the patient were blinded. For hiding after randomization by random allocation table, we selected and numbered the sample volume of the envelope and then wrote the control and intervention group identification sheets based on the output of the table and put them in the envelope and then sealed the envelope to allocate medicine or We provided control to the secretary or medical staff.

Participants/Inclusion and exclusion criteria

Inclusion criteria: 1-Diabetic patients and HbA1c less than 9 %. 2-25-hydroxy vitamin d serum level less than 20 ng per ml. 3-Aged 30-60. Exclusion criteria: 1- Lack of interest in participating in study. 2-Use of vitamin D supplements during the last 3 months. 3-Kidney and liver diseases, malabsorption syndrome, severe infection. 4- Use of immunosuppressive drugs. 5-Pregnancy and lactation. 6-Use of insulin.

Intervention groups

The intervention group received an injectable vitamin D supplement at a dose of 400,000 IU in two injections (200,000 IU each time) and the control group did not receive any specific intervention.

Main outcome variables

Determination and comparison of mean serum levels of vitamin D, tumor necrosis factor-alpha and soluble form of vascular cell adhesion molecule -1 between and within the study groups.

Scientific title
The effect of vitamin D injection on tumor necrosis factor alpha (TNF) and vascular cell adhesion molecule 1 (SVCAM-1) in vitamin D deficient patients with Type 2 Diabetes

Public title
Effect of vitamin d on inflammatory factors

Purpose
Prevention

Inclusion/Exclusion criteria
Inclusion criteria:
 Having diabetes and HbA1c less than 9 percent 25-hydroxy vitamin d serum level less than 20 ng per milliliter Aged 30-60
Exclusion criteria:
 Lack of interest in participating in the study Vitamin d supplement intake in last 3 month Impaired absorption, liver and kidney diseases and severe infection Immune system suppressor medication Pregnancy and lactation Insulin using

Age
From **30 years** old to **60 years** old

Gender
Both

Phase
1-2

Groups that have been masked

- Participant
- Investigator
- Outcome assessor

Sample size
Target sample size: **50**

Randomization (investigator's opinion)
Randomized

Randomization description
The 50 patients included in the study will be divided into intervention group with monthly vitamin D injection (25 subjects) and control group (25 subjects) using simple randomization and SPSS statistical software. Individuals will be randomly assigned to intervention and control groups.

Blinding (investigator's opinion)
Double blinded

Blinding description
For concealment after randomization by the random allocation table, we select and number the envelope sample size and then write the control and intervention group identification sheets based on the output of the table and then provide the sealed envelope for drug or control allocation for medical staff.

Health conditions studied

1

Description of health condition studied

Diabetic patients with vitamin D deficiency.

ICD-10 code

E08

ICD-10 code description

Diabetes mellitus due to underlying condition

Primary outcomes

1

Description

Tumor necrosis factor alpha.

Timepoint

before intervention, 2 month after intervention.

Method of measurement

Using laboratory kits for measuring the desired factors with ELISA technique.

2

Description

soluble vascular cell adhesion molecule 1

Timepoint

before intervention, 2 month after intervention.

Method of measurement

Using laboratory kits for measuring the desired factors with ELISA technique.

Secondary outcomes

empty

Intervention groups

1

Description

Intervention group: Doses of 200,000 international units of vitamin D were injected at the beginning and one month after the start of the study, a total of 400,000 international units.

Category

Prevention

2

Description

Control group: The control group does not receive anything.
