Iranian Registry of Clinical Trials

22 Jul 2026

Comparison of the effectiveness of Valsalva maneuver and Lidocaine injection in reducing pain caused by Etomidate injection to induce anesthesia

Protocol summary

Study aim

To compare Valsalva maneuver, lidocaine, and Valsalva maneuvers along with administration of lidocaine to reduce the pain associated with administration of etomidate in Alzahra hospital in 2019

Design

Open label randomized clinical trial, with three parallel groups, randomized with block randomization, phase 3, on 90 patients overall.

Settings and conduct

The study is a clinical trial, in which cases are divided into 3 groups by block randomization: 1. Valsalva maneuver, 2. lidocaine, and 3. Valsalva maneuver along with prescription of lidocaine. It will be carried out in October 2020, in Alzahra hospital, Isfahan, Iran. After informed consent, Candidates for sedation with Etomidate are divided in 3 groups and their demographic information and VAS scores are recorded. Only data analyst is blinded in this study.

Participants/Inclusion and exclusion criteria

Inclusion criteria: 1. physical class I or II 2. Age between 18 to 65 3. Etomidate administration as sedative. Exclusion criteria: 1. History of mental, cardiac and respiratory disease 2. Chronic pain disorders 3. Long history of analgesic use 4. History of allergic reactions to etomidate or lidocaine 5. History of drug abuse

Intervention groups

Group 1- Performing Valsalva maneuver by the patient ; 2- Lidocaine injection; and 3- Lidocaine injection while the patient is performing Valsalva maneuver. Lidocaine dose is 1 mg/Kg of body patient's weight slow bolus intravenous (over 2-3 min).

Main outcome variables

Visual Analog Scale (VAS) for pain Objective physician-assessed pain score; with: 0= no pain; 1= mild pain, pain that only is reported by the patient, and no signs of pain are observed by the physician; 2= Moderate pain, one

pain sign is observed in addition to patient's report 3= Severe pain with loud noise or moaning.

Scientific title

Comparison of the effectiveness of Valsalva maneuver and Lidocaine injection in reducing pain caused by Etomidate injection to induce anesthesia

Public title

The effect of Valsalva maneuver and Lidocaine injection on reducing the pain of Etomidate injection

Purpose

Prevention

Inclusion/Exclusion criteria**Inclusion criteria:**

Candidates for general anesthesia Physical condition in ASA class I and II Age 18 to 65 years Able to perform Valsalva maneuver

Exclusion criteria:

History of mental, cardiac and respiratory diseases Chronic pain disorders Long history of analgesic use History of allergies to Etomidate and Lidocaine History of drug abuse

AgeFrom **18 years** old to **65 years** old**Gender**
