Effectiveness of routine physical therapy with and without neuromobilization technique on range of motion and functional mobility of upper extremity in sub-acute stroke patients

Protocol summary

Study aim

To evaluate the effectiveness of routine physical therapy with and without neuromobilization technique on range of motion and functional mobility of upper extremity in sub-acute stroke patients.

Design

Randomized clinical trial, parallel groups, no blinding

Settings and conduct

The participants fulfilling criteria were allocated from Omer medical centre, Yaseen medical centre, UOL teaching hospital, Pakistan.

Participants/Inclusion and exclusion criteria

sub-acute stroke patients, aged 40-60 years with spasticity (modified Ashworth Scale with Grade 1, 2 spasticity) were included in this study. While the patients with any other disorder such as cognitive impairment, joint deformity, visual impairment, any other neurological or muscular disorder were excluded.

Intervention groups

Control group received the routine physical therapy treatment that included Tens, hot pack, muscles stretching and range of motion exercises. Each session was given for almost 45-60 minutes thrice a week for 8 weeks. Experimental group received routine physical therapy with neuromobilization of median, radial and ulnar nerve for 8 weeks. Each session was given for almost 45-60 minutes.

Main outcome variables

Range of motion of upper limb Functional mobility of upper limb

Scientific title

Effectiveness of routine physical therapy with and without neuromobilization technique on range of motion and functional mobility of upper extremity in sub-acute

stroke patients

Public title

Effects of neuromobilization on upper extremity in stroke patients

Purpose

Treatment

Inclusion/Exclusion criteria

Inclusion criteria:

Sub-acute stage (3 weeks to 6 months after onset)
Spastic paralysis (according to the modified Ashworth Scale with Grade 1, 2 spasticity) age 40-60 years both male and female

Exclusion criteria:

Cognitive deficiency that would impede the testing procedures
Surgical history of upper limb Joint deformities of the upper limb
Hemi neglect, visual problem
Any neurological or orthopedic diseases affecting their Upper Limb

Age

From **40 years** old to **60 years** old

Gender

Female

Phase

N/A

No information

Sample size

Target sample size: **30**

Actual sample size reached: **26**

Randomization (investigator's opinion)

Randomized

Randomization description

30 participant will allocated equally in control or experimental group by simple randomization. A random number table was generated using computer. All random numbers were kept in a sealed envelope. For each patient a sealed envelope was opened and according to mentioned number, group was allocated.

Blinding (investigator's opinion)

Not blinded

Health conditions studied

1

Description of health condition studied

Stroke

ICD-10 code

I63.50

ICD-10 code description

Cerebral infarction due to unspecified occlusion or stenosis of unspecified cerebral artery

Primary outcomes

1

Description

Range of Motion

Timepoint

Before intervention, 4th week of intervention, 8th week of intervention

Method of measurement

Goniometry

2

Description

Functional Mobility

Timepoint

Before intervention, 4th week of intervention, 8th week of intervention

Method of measurement

Wolf motor functional scale

Secondary outcomes

empty

Intervention groups

1

Description

Control Group: received the routine physical therapy treatment that included TENS, hot pack, muscles stretching and range of motion exercises. Each session was given for almost 45-50 minutes. In a session, TENS and hot pack was given for 15 minutes. Static stretching of affected muscles was performed according to the participant requirement. The range of motion exercises included arm cradling, table top position, while sitting leans forward and reaches both hands down to the floor and in Supine hands are clasped together and placed

behind the head, the elbows fall flat to the mat. For muscles strengthening, exercises with free weight and elastic bands were performed, resistance depending upon patients muscle strength. Fifteen repetitions of each exercise was given with a resting period of 1 minute between exercises

Rehabilitation

2

Description

Intervention group: received routine physical therapy with 2 sessions of neuromobilization of median, radial and ulnar nerve per weeks for 8 weeks. Each session was given for almost 45-50 minutes. In one session, routine physiotherapy mentioned above was given with dynamic neuromobilization (20 rep).
