

Clinical Trial Protocol

Iranian Registry of Clinical Trials

17 Sep 2026

Evaluation of the effect of Peritoneal repair or non-repair on Complications after Open Appendectomy

Protocol summary

Study aim

Evaluation of the effect of peritoneal repair or non-repair on complications after open appendectomy

Design

Randomized specific study of intervention and control groups, blinded, parallel, supportive

Settings and conduct

candidates for surgery are randomly assigned to open appendectomy with two methods of repair and non-repair of peritoneum, followed by a telephone call and invitation to visit in person. Patients are visited at the specified time and are clinically examined for local postoperative complications, and the information about each of these complications is recorded and analyzed separately. If any of the complications that endanger the patient's condition are confirmed, the patient will be re-hospitalized

Participants/Inclusion and exclusion criteria

Patients with diagnosis of appendicitis and candidate for open appendectomy

Intervention groups

Perform open appendectomy with two methods of repair and non-repair of peritoneum

Main outcome variables

Severity of complications ,Incidence of complications

Scientific title

Evaluation of the effect of Peritoneal repair or non-repair on Complications after Open Appendectomy

Public title

Evaluation of the effect of Peritoneal repair or non-repair on Complications after Open Appendectomy

Purpose

Supportive

Inclusion/Exclusion criteria

Inclusion criteria:

En Patients Candidate for open Appendectomy

Exclusion criteria:

Patients with a diagnosis other than appendicitis Patients

with a diagnosis of appendicitis are candidates for medical treatment

Age

No age limit

Gender

Both

Phase

N/A

Groups that have been masked

No information

Sample size

Target sample size: **128**

Actual sample size reached: **128**

Randomization (investigator's opinion)

Randomized

Randomization description

Simple, individual randomization, random number table randomization Random number table is a set of numbers that are generated without a specific pattern or order and in a completely random manner and become a table. In order to use the table of random numbers, we first predetermined the table to read the numbers, then we considered the numbers for different groups, then we touched one of the numbers and moved in one of the predefined directions and recorded the numbers and We assigned to different groups.

Blinding (investigator's opinion)

Not blinded

Blinding description

Placebo

Health conditions studied

1

Description of health condition studied

Appendicitis

ICD-10 code

K35.80

ICD-10 code description

Unspecified acute appendicitis

Primary outcomes

1

Description

Relative frequency of hernia, relative frequency of operation site pain; Relative frequency of postoperative wound infection; Relative frequency of obstruction symptoms

Timepoint

One week, three months and six months after surgery

Method of measurement

Depending on the severity of the symptoms:
asymptomatic, mild, moderate, severe

Secondary outcomes

empty

Intervention groups

1

Description

Intervention group: Peritoneal repair in 64 patients and postoperative visit three times

Category

Treatment - Surgery

2

Description

Control group: Non-peritoneal repair in 64 patients and postoperative visit three times

Category

Treatment - Surgery
