Evaluation of clinical results of latissimus dorsi tendon transfer to humeral head for irreparable massive rotator cuff tear

Protocol summary

Study aim

Evaluation of clinical results of latissimus dorsi tendon transfer to humeral head for irreparable massive rotator cuff tear

Design

This study is clinical trial is before and after. A total of 25 patients with extensive and irreparable rupture of the rotator cuff are enrolled.

Settings and conduct

The study is clinical trial is before and after. A total of 25 patients with extensive and irreparable rupture of the rotator cuff are enrolled. This study is clinical trial. Outcome evaluator and analyzer are blind. Outcome evaluator and analyzer don't aware from grouping.

Participants/Inclusion and exclusion criteria

Inclusion criteria: Age less than 70 years, absence of osteoarthritis of the shoulder joint, patients with irreversible anterior or posterior superior rupture, extensive and irreparable rupture of the rotator cuff
Exclusion criteria: Dissatisfaction

Intervention groups

All patients undergo shoulder surgery and transfer of the latissimus dorsi tendon to the humerus.

Main outcome variables

Shoulder rise from the front, external shoulder rotation, internal shoulder rotation, pain

Health conditions studied**1****Description of health condition studied**

irreparable massive rotator cuff tear

ICD-10 code

M75.1

ICD-10 code description

Rotator cuff tear or rupture, not specified as traumatic

Primary outcomes**1****Description**

Shoulder rise from the front

Timepoint

3 and 6 months after surgery

Method of measurement

Oblique

2**Description**

External shoulder rotation

Timepoint

3 and 6 months after surgery

Method of measurement

Oblique

3**Description**

Internal shoulder rotation

Timepoint

3 and 6 months after surgery

Method of measurement

Observation

4**Description**

Pain

Timepoint

3 and 6 months after surgery

Method of measurement

Constant-Murley Shoulder Outcome Score

Secondary outcomes

empty

Intervention groups**1****Description**

Intervention group: All patients undergo shoulder surgery and transfer of the latissimus dorsi tendon to the humerus. In a semi-sitting position under general anesthesia with a lattice dorsopectomy approach, the dorsum shaft is detached from the front of the head to a small tuberosity with a 5-strand thread. It is then stretched. Abduction braces are taken.
