18 Sep 2026

The effect of heating the tip of the endotracheal tube with warm normal saline before intubation in decreasing the prevalence of hoarseness and sore throat after removal of the tube

Protocol summary

Study aim

The effect of heating the tip of the endotracheal tube with warm normal saline before intubation in decreasing the prevalence of hoarseness and sore throat after removal of the tube

Design

A parallel, double-blind clinical trial with parallel groups, randomized by www.randomizer.at website, performed on 58 patients in the two equal groups.

Settings and conduct

This study will be done at Hazrat-e-Rasoul hospital. In the control group (n=29) the normal endotracheal tube will not be heated and in the intervention group (n=29) the endotracheal tube will be heated with normal saline 40 ° C. Eligible patients were randomly divided into two groups of heated endotracheal tube with normal saline 40 degrees Celsius and normal saline using the site <https://www.randomizer.at/>.

Participants/Inclusion and exclusion criteria

Inclusion criteria were age between 19-63, surgery needed to general anesthesia and lack of cold or throat infections. Exclusion criteria: surgery on the neck and chest, clear hoarseness, previous laryngeal surgery, need for an abnormal position during the operation

Intervention groups

In the control group (n=29) the normal endotracheal tube will not be heated and in the intervention group (n=29) the endotracheal tube will be heated with normal saline 40 ° C. Intervention is not medication and is related to equipment.

Main outcome variables

Sore throat, hoarseness

Scientific title

The effect of heating the tip of the endotracheal tube with warm normal saline before intubation in decreasing the prevalence of hoarseness and sore throat after removal of the tube

Public title
The effect of heating the tip of the endotracheal tube on hoarseness and sore throat

Purpose
Prevention

Inclusion/Exclusion criteria
Inclusion criteria:
Age between 19-63 Surgery needed to general anesthesia Lack of cold or throat infections Satisfaction to participate in the study
Exclusion criteria:
Surgery on the neck and chest Clear hoarseness Previous laryngeal surgery Need for an abnormal position during the operation

Age
From **19 years** old to **63 years** old

Gender
Both

Phase
N/A

Groups that have been masked

- Participant
- Data analyser

Sample size
Target sample size: **58**

Randomization (investigator's opinion)
Randomized

Randomization description
Eligible patients were randomly divided into two groups of heated endotracheal tube with normal saline 40 degrees Celsius and normal saline using the site <https://www.randomizer.at/>.

Blinding (investigator's opinion)
Double blinded

Blinding description
Patients were unaware of being in the intervention groups and remained blind until the end of the study because they are anesthetized , and the statistical analyzer also received the data as a code, not the actual grouping, such as group A for intervention and B for control.

Placebo

Pain in throat

Primary outcomes

1

Description

Sore throat

Timepoint

20 minutes and 24 hours after endotracheal tube removal

Method of measurement

Examination (Yes/no)

2

Description

Hoarseness

Timepoint

20 minutes and 24 hours after endotracheal tube removal

Method of measurement

Examination (Yes/no)

Secondary outcomes

empty

Intervention groups

1

Description

Intervention group: After general anesthesia, in the intervention group (n = 29), the endotracheal tube heated with normal saline 40 ° C (product of Supa

company) will be intubated.

Category

Prevention

2

Description

Control group: After general anesthesia, in the control group (n = 29), the normal endotracheal tube (unheated) (product of Supa company) will be intubated.
