Effect of oral Vitamin C on rate of Atrial Fibrillation in Post-CABG patients referred to BuAli Sina hospital in Qazvin during 2017-2018

Protocol summary

Study aim

Evaluation of the reduction in the incidence of atrial fibrillation following the administration of vitamin C in patients with open heart surgery

Design

Randomized controlled trial, Triple blinded, Phase 2 on 140 patients, Randomisation was done with used a random number table

Settings and conduct

By multi-stage random sampling, among patients undergoing CABG at Buali Sina Hospital in Qazvin

Participants/Inclusion and exclusion criteria

Inclusion criteria: all patients candidates for coronary artery bypass grafting and exclusion criteria: history of previous atrial fibrillation; having a permanent pacemaker; any definite or possible evidence of any ventricular or supraventricular arrhythmia; severe left ventricular enlargement; severe valvular heart disease; myocardial infarction and ejection fraction less than or equal to 30%.

Intervention groups

Group "A" is the intervention group for which vitamin C at a daily dose of 1 gram was started 24 hours before surgery and continued until 48 hours after surgery. While patients in group "B" or the same control group were prescribed placebo. It should be noted that in both groups, due to the proven effect of atorvastatin in reducing the incidence of atrial fibrillation in order not to deprive patients at a dose of 40 mg daily was prescribed.

Main outcome variables

Incidence of AF in patients after CABG

Scientific title

Effect of oral Vitamin C on rate of Atrial Fibrillation in Post-CABG patients referred to BuAli Sina hospital in Qazvin during 2017-2018

Public title

Effect of oral Vitamin C on rate of Atrial Fibrillation in Post-CABG patients

Purpose

Prevention

Inclusion/Exclusion criteria

Inclusion criteria:

All patients that are candidate for coronary artery bypass graft surgery

Exclusion criteria:

History of previous atrial fibrillation Having a permanent pacemaker Any conclusive or probable evidence of any ventricular or supraventricular arrhythmias Severe valvular disease heart attack EF≤30%

Age

From 20 years old

Gender

Both

Phase

3

Sample size

Target sample size: 140

Randomization (investigator's opinion)

Not randomized

Randomization description

Blinding (investigator's opinion)

Triple blinded

Blinding description

This study is three-blind and each patient receives a code and both patients who received vitamin C and did not receive vitamin C. are performed by one of the nurses. The main collaborators of the project and the patients and the person who finally analyzes the results are all unaware of which patient is in which group.
