Comparison of sevoflurane with and without propofol for laryneal mask airway insertion in children; a double-blinded clinical trial

Protocol summary

Study aim

The aim of this study was to compare the effect of sevoflurane with and without propofol for laryneal mask airway insertion in children.

Design

A clinical trial with parallel, double-blind, randomized by randomizer website, phase 3 was performed on 36 patients in both equal groups.

Settings and conduct

Phase 3 clinical trial with two parallel groups was performed on 36 patients referred to Shahid Motahari Hospital in Urmia. Patients were enrolled in two equal groups (sevoflurane with propofol group = 18 people and sevoflurane without propofol group = 18 people). In this study, patients and clinical assessor as well as statistical analyzers were unaware of group assignment. Randomization was done by randomizer website.

Participants/Inclusion and exclusion criteria

Inclusion criteria were age between 2 to 8 years old, American Society of Anesthesiologists (ASA) I and II and abdominal and lower limb surgeries. Exclusion criteria were dissatisfaction of parents to participate in the study, the possibility of surgery with spinal anesthesia.

Intervention groups

Intervention group: In this group, sevoflurane with propofol was used before inserting laryngeal mask in children. Control group: In this group, sevoflurane without propofol was used before inserting laryngeal mask in children.

Main outcome variables

Time to reach the desired relaxation for laryngeal mask insertion, heart rate

Scientific title

Comparison of sevoflurane with and without propofol for laryneal mask airway insertion in children; a double-blinded clinical trial

Public title

Effect of sevoflurane and propofol for laryneal mask

airway insertion

Purpose
Treatment

Inclusion/Exclusion criteria
Inclusion criteria:
Age between 2 to 8 years old American Society of Anesthesiologists (ASA) I and II Abdominal and lower limb surgeries
Exclusion criteria:
Dissatisfaction of parents to participate in the study
Possibility of surgery with spinal anesthesia

Age
From **2 years** old to **8 years** old

Gender
Both

Phase
3

Groups that have been masked

- Participant
- Data analyser

Sample size
Target sample size: **36**
Actual sample size reached: **36**

Randomization (investigator's opinion)
Randomized

Randomization description
Candidate children for abdominal and lower limb surgery were randomly divided into two groups receiving sevoflurane with and without propofol using <https://www.randomizer.at/>.

Blinding (investigator's opinion)
Double blinded

Blinding description
Patients were unaware of their placement in the intervention groups and the statistical analyzer received the data in code, not the actual grouping.

Placebo
Not used

Assignment
Parallel

Health conditions studied

1

Description of health condition studied

Laryneal mask airway insertion in children

ICD-10 code

ICD-10 code description

Primary outcomes

1

Description

Time to reach the desired relaxation for laryngeal mask insertion

Timepoint

Due to the nature of the variable under study, which is time, only once from the time of administration of sevoflurane to the desired relaxation was considered

Method of measurement

Timer by second

Secondary outcomes

1

Description

Heart rate

Timepoint

Once during laryngeal mask insertion

Method of measurement

Pulsoximeter

Intervention groups

1

Description

Intervention group: Patients in the intervention group underwent induction of anesthesia with 8% sevoflurane with oxygen and N2O in equal proportions. The criterion of anesthesia was the disappearance of the eyelid reflex. Laryngeal mask was inserted 90 second after anesthesia by skilled person. During this time, the patient received only 8% sevoflurane with oxygen and N2O in equal proportions and 1 mg/kg propofol (Produced by ABIAN Pharmed).

Treatment - Drugs

2

Description

Control group: Patients in the control group underwent induction of anesthesia with 8% sevoflurane with oxygen and N2O in equal proportions. The criterion of anesthesia was the disappearance of the eyelid reflex. Laryngeal mask was inserted 90 second after anesthesia by skilled person. During this time, the patient received only 8% sevoflurane with oxygen and N2O in equal proportions.
