Investigation on Safety and Efficacy of Autologous Human Fibroblasts Transplantation in Regeneration of Atrophic Cutaneous Leishmaniasis Scar.

Protocol summary

Study aim

To study the safety and efficacy of autologous fibroblast transplantation into atrophic scar of cutaneous leishmaniasis.

Design

A pilot study on Safety and Efficacy of Autologous Human Fibroblasts Transplantation in Regeneration of Atrophic Cutaneous Leishmaniasis Scar. Five patients are treated with their autologous dermal fibroblasts. The scars are investigated before and after transplantation.

Settings and conduct

In this pilot study, ear skin biopsies taken from patients at Center of Research and Training in Skin Diseases and Leprosy. The samples are moved to clean room at Iran University of Medical Sciences to isolate fibroblasts. The cells are injected into the lesions 3 times with 2 months intervals and 2, 6, and 12 months follow ups using VisioFace, Sonography and Cotometer.

Participants/Inclusion and exclusion criteria

Inclusion Criteria 1- Ages 15-65 2- Scar lesions caused by Cutaneous leishmaniasis grade 3 to 7 3- The willingness to provide informed consent, the ability to communicate with the investigator during follow ups. Exclusion Criteria 1- Use of Retinoids in the last 6 months 2- Pregnancy 3- Laser therapy in the last 6 months 4- Cancer or any chronic systemic disease 5- Chemical therapy 6- Mesotherapy 7- Active infection to Leishmaniasis 8- Organ or cell transplantation 9- Autoimmune disease 10- Breast feeding 11- Dermal Filler in the last 6 months 12- Plastic surgery at the site of Cutaneous leishmaniasis lesion 13- Use of Corticosteroids 14- Excessive exposure to sun 15- Participation in other clinical trials, using systemic medication or other treatment that might interfere with this study 16- Evidence of infection in the lesion or elsewhere on body.

Intervention groups

- Clinical grade Autologous Fibroblast Transplantation in

the lesions caused by cutaneous leishmaniasis .

Main outcome variables

Dermal Thickness; Scar Diameter; Elasticity; Patient satisfaction

Scientific title
Investigation on Safety and Efficacy of Autologous Human Fibroblasts Transplantation in Regeneration of Atrophic Cutaneous Leishmaniasis Scar.

Public title
Fibroblast in Cutaneous Leishmaniasis

Purpose
Treatment

Inclusion/Exclusion criteria
Inclusion criteria:
Ages 15-65 Scar lesions caused by Cutaneous leishmaniasis grade 3 to 7; The willingness to provide informed consent for participation in the trial and the ability to communicate with the investigator during follow ups.
Exclusion criteria:
Use of Retinoids in the last 6 months Pregnancy Laser therapy in the last 6 months Cancer or any chronic systemic disease Chemical therapy Mesotherapy Active infection to Leishmaniasis in the scar Organ or cell transplantation Autoimmune disease Breast feeding Dermal Filler in the last 6 months Plastic surgery at the site of Cutaneous leishmaniasis lesion Use of Corticosteroids Excessive exposure to sun. Subjects who are enrolled in any other clinical trial using systemic medication; or any other treatment that might interfere with this study Subjects with evidence of infection on area to be treated or elsewhere on body.

Age
From **15 years** old to **65 years** old

Gender
Both

Phase
1

Groups that have been masked
No information

Sample size
Target sample size: **5**
More than 1 sample in each individual
Number of samples in each individual: **5**
The group treated with Autologous Fibroblast

Health conditions studied

1

Description of health condition studied

Cutaneous Leishmaniasis

ICD-10 code

B55.1

ICD-10 code description

Cutaneous leishmaniasis

Primary outcomes

1

Description

Dermal thickness

Timepoint

Before intervention, 2, 6 and 12 months after the third transplantation of Fibroblasts

Method of measurement

Sonography

2

Description

Elasticity

Timepoint

Before intervention, 2, 6 and 12 months after the third transplantation of Fibroblasts

Method of measurement

Cotometer

3

Description

wound Diameter
Timepoint
Before intervention, 2, 6 and 12 months after the third transplantation of Fibroblasts
Method of measurement
visioFace

Secondary outcomes

1

Description
Patients Satisfaction
Timepoint
Before intervention, 2, 6 and 12 months after the third transplantation of Fibroblasts
Method of measurement
Questionnaire

Intervention groups

1

Description
Intervention group: Fibroblast Transplantation on number of 5 patients suffered from Cutaneous leishmaniasis to regenerate scar lesions after three subsequent fibroblast injections (20 mil/ turn) with 2 months intervals. scars are evaluated before and after transplantation.
