

Clinical Trial Protocol

Iranian Registry of Clinical Trials

18 Jun 2026

Comparative study of breast mass evaluation by a new diagnostic method (Breast Light) and mammography in women over forty years

Protocol summary

Study aim

Determining the diagnostic value of the new device (Breast Light) in comparison with mammography for evaluating breast masses

Design

The present study is one of the studies evaluating diagnostic tests and screening. All eligible people (including 252 people) will be examined with both Brestlight and mammography diagnostics based on available sampling. Clearly, blinding and randomization do not apply in this study.

Settings and conduct

In this study, 252 women over the age of 40 who are candidates for breast cancer screening or who have symptoms such as mastalgia, nipple discharge, changes in the appearance of the breast, etc., according to the doctor, need to be screened for diagnostic methods. Initially, the specialist will evaluate the breast tissue using a burst light device in a dark room through direct contact of the probe with the skin of the person. Seeing the dark areas of the cluster indicates malignancy and the results will be recorded by the specialist. They should then be re-examined with a mammogram. It should be noted that in people who will be diagnosed with the disease will be directed to continue treatment and biopsy.

Participants/Inclusion and exclusion criteria

Inclusion criteria: Women 40 years of age and older, women candidates for breast cancer screening
Exclusion criteria: Reluctance to undergo screening with Brest Light, pregnancy

Intervention groups

In this study, two diagnostic interventions, Brest Light and mammography, will be used to evaluate breast masses. In this way, all the subjects will be examined first using the new Brest Light diagnostic method, and then mammography will be performed

Main outcome variables

Primary outcome variables include true positive, true

negative, false positive, and false negative of the diagnostic test Brest Light

Scientific title
Comparative study of breast mass evaluation by a new diagnostic method (Brest Light) and mammography in women over forty years

Public title
Evaluation of breast mass diagnosis with breast light and mammography

Purpose
Screening

Inclusion/Exclusion criteria
Inclusion criteria:
Women aged 40 and over Women who are candidates for breast cancer screening
Exclusion criteria:
pregnancy Reluctance to perform the screening process by Brest Light

Age
From **40 years** old

Gender
Female

Phase
N/A

Groups that have been masked
No information

Sample size
Target sample size: **252**
More than 1 sample in each individual
Number of samples in each individual: **2**
Each participant is first examined with a Brest Light device and then the same person is examined with a mammogram, so there will be two samples for each person to examine breast masses

Randomization (investigator's opinion)
N/A

Randomization description

Blinding (investigator's opinion)
Not blinded

Blinding description

Placebo
Not used

Assignment
Single

Health conditions studied

1

Description of health condition studied

Diagnosis and screening of breast mass

ICD-10 code

ICD-10 code description

Breast screening

Primary outcomes

1

Description

The true positive detection rate of the Brest Light device

Timepoint

When using the Brest Light device, and then with a subsequent examination by mammography

Method of measurement

By examining the number of people who are positive for the Brest Light screening test, and these people are diagnosed as really ill with a subsequent examination through mammography and biopsy

2

Description

The true negative detection rate of the Brest Light device

Timepoint

When using the Brest Light device, and then with a subsequent examination by mammography

Method of measurement

By examining the number of people who are negative for the Brest Light screening test, and these people are diagnosed as really health with a subsequent examination through mammography

3

Description

The false positive detection rate of the Brest Light device

Timepoint

When using the Brest Light device, and then with a subsequent examination by mammography

Method of measurement

By examining the number of people who are positive for

the Brest Light screening test, if by the next check by mammography these people are healthy

4

Description

The false negative detection rate of the Brest Light device

Timepoint

When using the Brest Light device, and then with a subsequent examination by mammography

Method of measurement

By examining the number of people who are negative for the Brest Light screening test, if by the next check by mammography these people are ill

Secondary outcomes

1

Description

Brest Light diagnostic sensitivity

Timepoint

When using the Brest Light device, and then with a subsequent examination by mammography

Method of measurement

Divide the number of people who have a positive diagnostic test and are really sick by the number of people who have a positive screening result

2

Description

Brest Light diagnostic specificity

Timepoint

When using the Brest Light device, and then with a subsequent examination by mammography

Method of measurement

Divide the number of people who have a negative diagnostic test and are really healthy by the number of people who have a negative screening result

Intervention groups

1

Description

Intervention group: The first intervention group includes all people for whom the Brest Light diagnostic method is used to examine breast masses.

Category

Diagnosis

2

Description

Intervention group: The second intervention group includes the same people under the first intervention. This time, mammographic diagnostic method will be used to examine breast masses

Title and more details about the data/document

It is possible to share all the data while maintaining the principle of not mentioning the names of individuals

When the data will become available and for how long

Six months after the publication of the related article

To whom data/document is available

University researchers, gynecologists and radiologists

Under which criteria data/document could be used

The data of the present study can be used for additional research, after obtaining permission and approval from the Vice Chancellor for Research and Technology of Lorestan University of Medical Sciences.

From where data/document is obtainable

Refer to the project manager, Dr. Fatemeh Yari, with email address yari1672@yahoo.com, and contact number 09163613621

What processes are involved for a request to access data/document

After completing the research and publishing the relevant article, individuals can apply to the Vice Chancellor for Research and Technology of Lorestan University of Medical Sciences to receive documents and after obtaining permission from this department, send a confirmation from the Vice Chancellor for Research to the project manager. Can access documentation
