

Clinical Trial Protocol

Iranian Registry of Clinical Trials

14 Jul 2026

The effect of family centered education in invasive home mechanical ventilation patients

Protocol summary

Study aim

Determining of the effect of family-centered education on the level of performance and family burden at home

Design

Clinical trial, intervention and control group, randomized, single center, Sampling type: available eligibles, Segmentation: Random blocks with quadruple blocks

Settings and conduct

Place of study: Tehran University of Medical Sciences and Health Services

Participants/Inclusion and exclusion criteria

Inclusion criteria: Desire for participating in the study
The patient is under invasive home mechanical ventilation The primary caregiver is the person who has the most involvement in the treatment The caregiver should be able to read and write at least
Exclusion criteria: In case of participation in a study that interferes with the current study

Intervention groups

Intervention group: After obtaining informed consent and the completion of the researcher-made checklists, Home care training (routine and emergency) is given to the family in 5 sessions of 1 hour in 4 weeks.. Control group: After obtaining informed consent and the completion of the researcher-made checklists, They will receive routine intensive care training.

Main outcome variables

Family performance level, Family burden

Scientific title

The effect of family centered education in invasive home mechanical ventilation patients

Public title

Effect of family education at home

Purpose

Supportive

Inclusion/Exclusion criteria

Inclusion criteria:

Desire for participating in the study The patient is under

invasive home mechanical ventilation The primary caregiver is the person who has the most involvement in the treatment The caregiver should be able to read and write at least

Exclusion criteria:

In case of participation in a study that interferes with the current study

Age

From **18 years** old

Gender

Both

Phase

N/A

Groups that have been masked

No information

Sample size

Target sample size: **60**

Randomization (investigator's opinion)

Randomized

Randomization description

The sequence of random allocation and the list of blocks will be obtained by the statistical consultant with the help of software. The website

<http://www.sealedenvelope.com> is a useful site for generating random sequences for block type randomization. This site is designed in such a way that there is no limit on the number of groups for random allocation. Volume block method four is used to create random allocation sequences. Blocks consisting of two groups A and B randomly selected using the software such as (BAAB) , (ABBA) , (AABB) , (BBAB). Then 60 pockets (30 pockets containing paper A and 30 pockets containing paper B) will be prepared based on sample size. According to a list of blocks, a trained person outside of the research team will be set the row of pockets. In the first stage, each patient will be randomly assigned to the A group (intervention) or B group (control). The sample process will be performed sequentially until the end of completion of sample size. Code of each patient will also be allocated to his family member. Patients are assigned to the study group in order of their entry into the study and randomly through randomized blocks. For example, according to the block (ABAB), each patient enters the intervention, control, intervention and control groups, respectively, after entering the study. This process continues until the last block is selected.

Blinding (investigator's opinion)

Double blinded

Blinding description

The assignment of the groups will be done by someone out of the study and the investigator won't have any information about the assigned group. The group code of individuals will only be available to the lead researcher (supervisor) and the evaluators will not be aware of it.

Health conditions studied

1

Description of health condition studied

Performance skills and family burden

ICD-10 code

ICD-10 code description

Primary outcomes

1

Description

Performance skills score in researcher-made checklists

Timepoint

Before and one week after education

Method of measurement

Researcher-made functional skills checklist

Secondary outcomes

1

Description

Family burden score

Timepoint

Three month after the intervention

Method of measurement

ZARIT burden questionnaire

Intervention groups

1

Description

After getting informed consent, the main family caregiver will receive routine and emergency care training including suction, gavage, skin care, and cardiopulmonary resuscitation via face to face and on a replica before the patient is discharged home. The duration of the training will be five one-hour training sessions. The mentioned training booklet will also be provided to the family.

Category

N/A

2

Description

In the control group, the main family member will receive routine intensive care unit training including suction, gavage and skin care in a brief training session during discharge.
