Comparison of Mulligan Bent Leg Raise versus Mulligan Traction Straight Leg Raise on pain intensity and hamstring flexibility in patients with non-specific chronic low back pain

Protocol summary

Study aim

To compare Mulligan Bent Leg Raise versus Mulligan Traction Straight Leg Raise on pain intensity and hamstring flexibility in patients with non-specific chronic low back pain

Design

Two-arm, parallel-group, randomized trial with blinded postoperative care and outcome assessment

Settings and conduct

The study was conducted at Health Care Physiotherapy, Sports, Spine& Rehabilitation Center, Faisalabad, 116 Patients were randomly allocated into groups, Group A received Mulligan Traction Straight Leg Raise (TSLR) while Group B patients received Mulligan Bent Leg Raised Technique (BLR).

Participants/Inclusion and exclusion criteria

Inclusion criteria: Age between 30-50 years, Both gender (male & female), Visual Analog Scale Pain Score 0-7 (Mild Pain 0-4, Moderate Pain 5-7), Non-specific chronic low back pain involving segmental hypomobility and gross limitation of lumbar mobility and restriction of SLR, due to discomfort & pain, 15° more as compared to the non-involved side. Exclusion criteria: Visual Analog Scale Pain Score 8-10 (Unbearable Pain), Patient already taking treatment for last 6 months, any neurological disease, any physical disability, Pregnancy, history of any surgical procedure involving back or lower extremity.

Intervention groups

Intervention group A: Traction Straight Leg Raise (TSLR) The Mulligan traction straight leg raise technique was used therapeutically to decrease pain and range of straight leg raise when it was limited due to tightness in hamstrings or dysfunction in the lower back. Group B: Bent Leg Raised Technique (BLR) The Mulligan bent leg raise method was used for improving the range of straight leg raise in subjects with nonspecific chronic low backache in order to improve hamstring flexibility in

individuals with hamstrings tightness.

Main outcome variables

Pain; range of motion

Scientific title
 Comparison of Mulligan Bent Leg Raise versus Mulligan Traction Straight Leg Raise on pain intensity and hamstring flexibility in patients with non-specific chronic low back pain

Public title
 Comparison of Mulligan Bent Leg Raise versus Mulligan Traction Straight Leg Raise on pain intensity and hamstring flexibility in patients with non-specific chronic low back pain

Purpose
 Treatment

Inclusion/Exclusion criteria
Inclusion criteria:
 Age between 30-50 Years Both Gender Male & Female
 Visual Analog Scale Pain Score 0-7 (Mild Pain 0-4, Moderate Pain 5-7) Non-specific chronic low backache involving segmental hypomobility and gross limitation of lumbar mobility Restriction of SLR, due to discomfort & pain, 15° more as compared to the non-involved side.
Exclusion criteria:
 Visual Analog Scale Pain Score 8-10 (Unbearable Pain)
 The patient already taking treatment for the last 6 months. any neurological disease Pregnancy History of any surgical procedure involving back or lower extremity

Age
 From **30 years** old to **50 years** old

Gender
 Both

Phase
 N/A

Groups that have been masked

Sample size
 Target sample size: **116**
 Actual sample size reached: **116**

Randomization (investigator's opinion)
 Randomized

Randomization description
 The randomization was done bases on the following steps Step-1: First the population of the study was exactly defined though inclusion criteria, complete list of people included in the population were made. The population of the study was 1,000 each person was labeled from one to one thousand. Step-2: The sample size of the study was 116 people calculated based on previous study. Sample of 116 people were selected using excel function RAND. The formula for this was “=RAND ()*1000” 116 random numbers were generated. Step-3: In this study researcher framed two groups, one was experimental group and other was control group, in each group 58 people were decided to include. To select 58 people for each group excel function RAND was used. First 116 people were labeled from one to one hundred

and sixteen.

Blinding (investigator's opinion)
 Single blinded

Blinding description
 The assessor was kept blind about either the patient belonged to the treatment group or the control group. A second physical therapist assessed pain and hamstring flexibility.

Intervention groups

1

Description

Intervention group 1: The Mulligan traction straight leg raise technique is used therapeutically to decrease pain and range of straight leg raise when it is limited due to tightness in hamstrings or dysfunction in lower back. Moist heating pads were applied on lower back & hamstrings muscles for 10 minutes before each treatment session. Bridging and flexion or extension biased exercises were also performed as baseline treatment. All patients received 06 treatment sessions in total over a three-week period.
