The Effect of Low Dose and High Dose Magnesium Sulphate on Hemodynamic Changes during Sternotomy and Laryngoscopy in Patients Undergoing Coronary Artery Bypass Graft Surgery

Protocol summary

Summary

Objective: Hemodynamic stability during anesthesia and surgery is one of the basic goals that every anesthesiologist wishes to achieve. Laryngoscopy and sternotomy are two major stresses to human body that could alter heart rate and blood pressure significantly. The primary goal of this study was to evaluate the effect of low and high doses of magnesium sulfate on mean arterial pressure of patients undergoing CABG during laryngoscopy and sternotomy and compare it with the placebo. Design: Randomized placebo controlled. Methods: 90 patients were randomly allocated in to three groups. Intervention: Patients in group one received a 20mg/kg bolus dose of magnesium sulphate over a period of 3 minutes followed by an infusion of magnesium sulphate (10 mg/kg/hour). Patients in group two received a 40mg/kg bolus dose of magnesium sulphate over a period of 3 minutes followed by an infusion of magnesium sulphate (20 mg/kg/hour). Patients in group three received placebo. Exclusion Criteria: Patients with left ventricular ejection fraction less than 40% , left ventricular aneurysm, valvular heart disease, previously documented hypertension and diabetes mellitus were not enrolled in the study. Outcome measures: Heart rate and blood pressure were recorded on arrival and before intubation and 2 and 4 minutes after intubation and 1 minute before sternotomy and 2 and 4 minutes after sternotomy.

Scientific title

The Effect of Low Dose and High Dose Magnesium Sulphate on Hemodynamic Changes during Sternotomy and Laryngoscopy in Patients Undergoing Coronary Artery Bypass Graft Surgery

Public title

The effect of Magnesium Sulphate on hemodynamics

Purpose

Prevention

Inclusion/Exclusion criteria

Inclusion criteria: Patients referred to our anesthesia clinic; Patients aged 40 to 80 years undergoing Coronary Artery Bypass Graft Surgery Exclusion Criteria: Patients with left ventricular ejection fraction less than 40% ; left ventricular aneurysm; valvular heart disease; previously documented hypertension; diabetes mellitus

Age

From **40 years** old to **80 years** old

Gender

Both

Phase

N/A

Groups that have been masked

No information

Sample size

Target sample size: **90**

Health conditions studied

1

Description of health condition studied

Other and unspecified disorders of circulatory system

ICD-10 code

I99

ICD-10 code description

Other and unspecified disorders of circulatory system

Primary outcomes

1

Description

Heart rate during intubation

Timepoint

Before intubation and 2 and 4 minutes after intubation

Method of measurement

Using patients monitoring

2

Description

Heart rate during sternotomy

Timepoint

Before sternotomy and 2 and 4 minutes after

Method of measurement

Using patients monitoring

Secondary outcomes

1

Description

Blood pressure during intubation

Timepoint

Before intubation and 2 and 4 minutes after

Method of measurement

Using sphygmomanometer

2

Description

Blood pressure during sternotomy

Timepoint

Before sternotomy and 2 and 4 minutes after

Method of measurement

Using sphygmomanometer

Intervention groups

1

Description

Patients in group one received a 20mg/kg bolus dose of magnesium sulphate over a period of 3 minutes followed by an infusion of magnesium sulphate 10 mg/kg/hour

Category

Prevention

2

Description

Patients in group two received a 40mg/kg bolus dose of magnesium sulphate over a period of 3 minutes followed by an infusion of magnesium sulphate(20 mg/kg/hour).

Category

Treatment - Drugs

3

Description

Patients in group three received saline as placebo for bolus and infusion.

Category

Treatment - Drugs
